largely influenced by this material. The roofs are usually tiled, and have characteristically a hollow dip, as if copied from the form of a tent. When rectangular, the lower corners are sharply turned up. Roofs in several projecting tiers, one over the other, are usual in temples and towers. The tiling of the roofs is often glazed in various colors, and the walls are frequently incrusted with porcelain tiles, and semetimes with marble slabs. The porcelain tower or ta of Nanking, destroyed in 1853, was a building of this nature; it was 200 feet high, had 9 stories, and was aurmounted hy an iron spire or finial. The pailow, or carved memorial gateway, is another feature of Chinese architecture. A peculiarity of Chinese building is the practice of beginning with the roof, which is supported on posts, and the walls are then built beneath it. Chinese drawing and painting are often of great delicacy, but show no knowledge of perspective. In the decorative branches of art, much of the work of the Chinese is of high merit. Their small brodyes, and carvings in wood and ivory, are of great technical excellence, and as makers and decorators of porcelains they'are unsurpassed. They are fond of the grotesque, and are very auccessful in decorative treatment of it, as, for instance, in their favorite carved and painted figures of dragous and kindred fantas-

tle creations.—Chinese blue, capstan, classics, cross-bow, duck, fire, glue, lantern, wax, white, yellow, etc. See the nouns.

2. The language of China. It is a monosyllable tongue, and on this ground is generally classed with the other languages of the same character in southeastern Asia, in Further India and the Himalayas, as constituting the monosyllable family. It exists in many dialects, of which the so-called Mandarin is the leading and official one. It is composed of only shout 500 words, as we should distinguish them in writing, all of them ending in a vowel-sound or in a nasal, although some of the dialects still retain flam mites, lost in Mandarin. This small body of words, however, is raised to 1,500 by differences of the tone of utterance, as rising, falling, even, abrupt, and so on. The language is without inflection, and even without distinction of parts of speech; but words are classed as "tull" or "empty," according as they are used with their full meaning or as auxiliarles in forming phrases: like our will and have in "I will it," "they have it," on the one hand, and in "they will have seen it," on the other. Chinese records go back to about 2000 B. C., and the literature is immense and varied. The mode of writing is by signa that represent each a single word in one of its senses or in a certain set of senses. The signs are of ideographic or hieroglyphic origin; but the greater part of them at present are compound, and many contain a phonetic element slong with an ideographic. They number in the dictionaries about 40,000; but only the smaller part of these are in current and familiar use. They are written in perpendicular columns, and the columns follow one another from right to left. The language and mode of writing have been earried to the neighboring ustions that have received their culture from China, especially Japan, Corea, and Annam, and have been more or less borrowed or adopted by such nations.

Chirotheca (kī-rō-thē'kä), n.; pl. chirotheca (kī-rō-thē'kä), n.; pl. chirotheca (kī-rō-thē'kā), n.; pl. chiroth of ineducabilian placental mammals, having the fore limbs modified for true flight by the enormous development of the manus or hand, upon the elongated and divaricated metaearpal and phalangeal bones of which a wing-membrane is spread out and connected with the sides of the body and with the hind limbs. The forearm is also elongated, and consists of a long, slender, curved radius, with a rudimentary ulna ankylosed at its proximal end; the thumb is short and has a claw, which is wanting on the other digits of the wings; the hind limbs are peculiarly rotated outward so that the knee is directed backward, and connected together by an interfemoral membrane, which also incloses a part or the whole of the tail, and is supported in part by a peculiar tarsat process, the calear (which is occasionally wanting). The order is also characterized by a discoid deciduate placenta. The teeth are heterodont and diphyodont, consisting of specialized incisors, canines, premolars, and molars, 38 or fewer in number; the body is furry; the wings are more or less naked; the penis pendent; the testes inguinal or abdominat; the mamme thoracte; and the cerebral hemispheres smooth and small, leaving the cerebellum exposed. The Chiroptera are extremely modified Insectivora whose organization is adapted for flight; they are among the most volitant and aerial of all creatures, being scarcely able to move except on the wing. Most of the bats are insectivorous or carnivorous, but some are frugivorous. The order is divided into the Megachiroptera or Prugivora, and the Microchiroptera or Animalivora. The number of species is about 400, of which those of the microchiropteran family Vespertilionide constitute considerably more than one third (about 150); the macrochiropterans, frugivorous bats, or Pteropodidae, are about 70 in number. The order is nearly cosmopolitan, being absent only from areits and antarctic regions, but is most numerously represented in the tropics1 regions of both hemispheres; the fruit-eating bats are not found in America.

1. In anc. Gr. costume, a form of mantle which left both arms free, worn especially by equestrians, hunters, and travelers, and by soldiers. The chlamys, which was much smaller than the himation, consisted of an oblong piece of stuff having three straight sides and one long side curved outward. It was worn by bringing the two ends of the straight side opposite the curved side together around the neck, and fastening them with a buckle or fibula. The buckle was pulled around to the front, to either shoulder, or to the back, to suit the convenience of the wearer. The extremities of the curved side were weighted so as to hang vertically; and when the chlamys was caught together on one shoulder, as it was commonly worn, these hanging ends were likened to wings by the old writers. The paludamentum of the later Roman emperors was called chlamys by the Greeks.

The chlamys [in the sculptures of the Mausoleum] floating behind the Amazon on horseback adds to its simplicity a massiveness of fold and general form beyond anything to be seen in similarly floating drapery on the others slabs.

\*χλόασμα, < χλοάζευ, be or become green, < χλόη,
verdure, grass: see chlor-, chlorin, etc.] Literally, greenness; in pathol, a name for a cutaneous affection characterized by patches of
a yellow or yellowish-brown color, the pityriasis versicelor, occurring most frequently on
the neck breast, abdomen, and groin. The

riasis versicelor, occurring most frequently on the neck, breast, abdomen, and groin. The name is also applied less definitely to a number of brownish discolorations.

Chloëphaga (klō-ef'a-gā), n. [NL. (T. C. Eyten, 1838), ⟨ Gr. χλοηφάγος, grass-eating, ⟨ χλοη, verdure, grass, + φαγείν, eat.] A genus of South American geese, of the subfamily Anserinæ and the family Anatidæ, containing such species as the Magellanic goose, C. magellanica. There are about 6 species.

In some words it represents English chlorin.

English chlorin.

chloracetate (klō-ras'e-tāt), n. [< chloracet(ic) + -ate¹.] A salt of chloracetic acid.

chloracetic (klō-ra-set'ik), a. [< chlor(in) + acetic.] Derived from chlorin and acetic acid.

- Chloracetic acid, an acid produced by the substitution of one, two, or three atoms of chlorin for hydrogen in acetic acid. It combines with bases, forming chloracetates.

chloragogic (klō-ra-goj'ik), a. [< Gr. χλωρός, pale-green, + ἀγωγή, a leading, conducting, ⟨ ἀγεν, lead.] A term applied to certain peculiarly modified perivisceral cells of some annelids. as carthworms, developed in connection

lids, as carthworms, developed in connection with the intestines, the nephridia, etc.

The distribution of the chloragogic cells is indicated by the dotting on the terminal section of the nephridium.

chloral (klō'ral), n. [< chlor(in) + al(cohol).] A colorless mobile liquid (CCl<sub>3</sub>.CHO), having an agreeable pungent smell and biting taste, first prepared by Liebig from chlorin and alcohol, afterward by Städeler by the action of chlorin on starch. The hydrate of chloral (CCl<sub>3</sub>-CH(OII)<sub>2</sub>), as now prepared, is a white crystalline substance having a pungent odor and an aerid taste. In contact with alkalis it separates into chloroform and formic acid. In medicine it is used as a hypnotic, and in doses of from 15 to 30 grains usually produces calm sleep, which lasts for several hours, and is not followed by unpleasant effects, such as frequently attend the use of morphine. In overdoses it paralyzes the nerve-centers, arresting respiration and the action of the heart, and causes death. When used continuously it may produce very serious effects on the system.

chloralism (klō'ral-izm), n. [ $\langle chloral + -ism.$ ]

1. The habit or practice of using chloral.—2. A diseased state of the system marked by varying symptoms arising from the incautious or habitual use of chloral. In extreme cases it is marked by meral degradation similar to that which characterizes alcoholism.

chloralist (klō'ral-ist), n. [< chloral + -ist.]
One addicted to the use of chloral.

chloralize (klō'ral-īz), v. t.; pret. and pp. chloralized, ppr. chloralizing. [< chloral + -ize.]
To affect with chloral; bring under the influence of chloral.

chloraloin (klē-ral'ō-in), n. [ $\langle$  Gr.  $\chi\lambda\omega\rho\delta\varsigma$ , yellowish-green, +  $\dot{a}\lambda\delta\eta$ , aloes, + - $\dot{m}^2$ .] A yellow non-crystalline substance derived from barbaloin by replacing six hydrogen atoms with

chloralum (klō'ral-um), n. [< chlor(id) + aluchloralum (klō'ral-um), n. [\scalent(id) + aunm(inium).] An antiseptic preparation containing aluminium chlorid, prepared by treating slightly roasted porcelain clay with crude muriatic acid. U. S. Dispensatory, p. 162.

chloranilic (klō-ra-nil'ik), a. [< chloranil + -ic.] Pertaining to or derived from chloranil. - Chloranilic acid, CoCloOs(OH)2, an acid derived from chloranil by the action upon it of mineral acids. It forms red shining scales.

compact prehnito, forming nodules in the amygdaloid of Isle Royale, Lake Superior. It has a delicate green color and radiated or stellate structure, and takes a high polish.

chlorate (klō'rāt), n. [< chlor(ic) + -atcl.] A salt of chloric acid. The chlorates are closely analogous to the nitrates. They are decomposed by a red heat, nearly all of them being converted into metallic chlorids, with evolution of pure oxygen. They deflagrate with inflammable substances with such facility that an explosion is produced by slight causes. The chlorates of sodium and potassium are used in medicine.

chlore (klōr), v. t. [< chlor(in).] In dycing, to subject to the action or influence of chlorin. See extract.

See extract.

Steam chloring consists in passing the goods first through a very weak solution of bleaching-powder, and immediately after through a large tank filled with steam; the moist heat sets the chlorine (hypochlorous acid) free, and thereby causes the oxidation of the small quantity of coloring matter adhering to the white portions of the fabric.

chlorin, chlorine (klō'rin), n. [⟨ Gr. χλωρός, greenish-yellow (see chlor-), + -in², -ine².] Chemical symbol, Cl; atomic weight, 35.37, An elementary gaseous substance contained in common salt, from which it is liberated by the action of sulphurio acid and manganese dioxid. Chlorin has a yellowish-green color and a peculiar amell, and irritates the nostrila very violently when inhaled, as also the trachea and lungs. It exercises a corrosive action upon erganic tissues. It is not combustible, though it supports the combustion of many bodies, and indeed spontaneously burns several. In combination with other elements it forms chlorids, which serve most important uses in many manufacturing processes. It can be liquefied by cold and pressure. It is one of the most powerful bleaching agents, this property belonging to it through its strong affinity for hydrogen. Hence in the manufacture of bleaching-powder (chlorid of lime) it is used in immense quantities. When applied to moistened colored fabrics, it acts by decomposing the moisture present, the oxygen of which then destroys the celoring matter of the material. It is a valuable disinfectant when it can be conveniently applied, as in the form of chlorid of lime. See calx chlorata, under calx1.—Chlorin process, in metal., a process extensively used for separating gold from silver. It is based upon the fact that gold at the action of sulphuric acid and manganese

The name of a group of minerals, most of which have a grass-green to olive-green color, and a micaecous structure. Some varieties are massive, consisting of fine acales; others are granular. They are hydrous silicates of sluminium, ferrous iron, and magnesium.

2. In chem., a salt of chlorous acid. The chlo-

rites are remarkable for their strong bleaching rites are remarkable for their strong bleaching and oxidizing properties.—Chlorite slate, a rock with slaty or schistose structure, consisting of chlorite, granular or in scales, with a little quartz and feldspar. chloritic (klō-rit'ik), a. [< chloritic, 1, + -ic.] Pertaining to or containing chlorite: as, chloritic sand. Also chloretic.

chloritoid (klō'ri-toid), a. [< chlorite, 1, + -oid.] A member of the chlorite group of minerals, of a dark-gray to green or black solor.

A member of the chlorite group of minerals, of a dark-gray to green or black color. chlorize (klō'rīz), r. t.; pret. and pp. chlorized, ppr. chlorizing. [< chlor(in) + -ize.] Same as chloro. See chlor-chlorocalcite (klō-rō-kal'sīt), n. [< Gr. χλωρός, yellowish-green, + L. calx (calc-), limestone, + -ite². bon'ik, klō-rō-kär'bo-nus), a. [< chlor(in) + carbon-ic, -ous.] Consisting of a compound of chlorin and carbonic oxid (COCl<sub>2</sub>), formed by exposing a mixture of the two gases to the direct solar rays.

chlorochrous (klō'rō-krus), a. [ζ Gr. χλωρός, yellowish-green, + χρόα, color.] Having a green

color.

chlorocyanic (klô"rō-si-an'ik), a. [< chlor(in) + cyan(ogen) + -ic.] Consisting of chlorin and cyanogen combined: as, chlorocyanic acid.

chlorodyne (klō'rō-din), n. [< chloro(form)

chlorodyne (klö'rō-din), n. [< chloro(form) + (nno)dyne.] A powerful anodyne remedy, varying somewhat in composition, but containing morphine, chloroform, prussic acid, and extract of Indian hemp, flavored with sugar and peppermint.

chloroform (klō'rō-fôrm), n. [\chlor(in) + form(yl).] Trichlormethane, or formyl trichlorid

(CHCl<sub>3</sub>); a volatile colorless liquid, of an agreeable sweetish taste and fragrant smell, and havable sweetish taste and fragrant smell, and having the specific gravity 1.48. It is prepared by cautiously distilling together a mixture of alcohol, water, and chlorid of lime or bleaching-powder. Its chief use is in medicine as an anesthetic in diseases attended with great pain, in surgical operations, and in childibirth. For this purpose its vapor is inhaied. The inhalation of chloroform first produces slight intoxication; then, frequently, slight muscular contractions, unrufiness, and dreaming; then loss of voluntary motion, consciousness, and sensibility, the patient appearing as if sound asleep; and at last, if too much is given, death by failure of the heart or respiration. When skilfully administered, in proper cases, it is a safe aneathetic. Chloroform is slightly inferior to ether in point of safety, but is quicker in its action and not so apt to produce vomiting, so that for certain cases it is preferred. It is a powerful solvent, dissolving resins, wax, lodine, etc., as well as strychnine and other alkaloids.—Gelatinized chloroform, chloroform shaken with white of egg until it gelatinizes.

chloroform (klō'rō-fōrm), v. t. [< chloroform, n.]

To subject to the influence of chloroform; administer chloroform to, for the purpose of indu-

minister chloroform to, for the purpose of inducing anæsthesia, unconsciousness, or death.

chloroformic (klō-rō-fôr'mik), a. [< chloroform + -ic.] Pertaining to, derived from, or obtained by means of chloroform.

The chloroformic and other extracts yielded crystala. Sci. Amer. Supp., p. 8708.

It [nitrobenzene] is soluble in sicohol, ether, and chloroform, but when agitated with water, it is in great part separated from its ethereal and chloroformic solutions.

A. S. Taylor, Med. Jour., p. 154.

chloroformization (klō-rō-fòr-mi-zā'shon), n. [⟨ chloroform + -ize + -ation.] 1. The act of administering chloroform as an anesthetic.

During etherization the warnings of danger are much more evident and more prolonged than during chlorofurmization.

Encyc. Amer., I, 219.

2. In mcd., the aggregate of anesthetic phenomena resulting from the inhalation of chlo-

chlorofucine (klō-rō-fū'sin), n. [⟨ Gr. χλωρός, pale-green, + L. fueus, red, rouge, + -inc².] A clear yellow-green coloring matter in plants, belonging to the chlorophyl group and closely resembling in its properties the blue and yellorophyl group and closely resembling in its properties the blue and yellorophyl group and closely resembling in its properties the blue and yellorophyl group and closely resembling in its properties the blue and yellorophyl group and closely resembling in the properties the blue and yellorophyl group and closely gro low chlorophyl pigments, but showing a differ-

P. ovum and P. hispidula are species of this genus.

chlorophæite (klō-rō-fē'īt), n. [ζ Gr. χλωρός, yellowish-green, + φαιός, dusky, blackish, + -ite².] A hydrous iron silicate sometimes found in amydaloidal tran-rocks. It is transpect and

ite<sup>2</sup>.] A hydrous iron silicate sometimes found in amygdaloidal trap-rocks. It is translucent and of a green color when newly broken, but soon becomes black and opaque. Also spelled chloropheite.

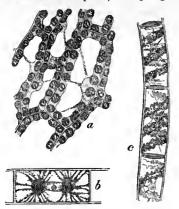

chlorophane (klō'rō-fān), n. [⟨Gr. χλωρός, yellowish-green, + -φανής, evident, ⟨φαίνειν, show.]

1. A variety of fluor-spar which exhibits a bright-green phosphorescent light when heated.

—2. A greenish-yellow coloring matter contained in the retina of the eye.

tained in the retina of the eye.

chlorophyl, chlorophyll (klō'rō-fil), n. [⟨NL. chlorophyllum, ⟨Gr. χλωρός, yellowish-green, + φύλλον = L. folium, a leaf.] The green coloring matter of plants; also, the substance within the mass of protoplasm which is colored by this matter. The former is distinguished as chlorophyl pigment, the latter as the chlorophyl grain or granule. Chlorophyl grains occur in the green parts of all plants, and are rarely found in cells that are not exposed to the light. In some of the lower cryptoganic plants they occupy and color the whole protoplasmic mass; in others they form bands or stellate shapes; but ordinarily they appear as minute rounded granules embedded in the protoplasm. These granules are the essential agent in the process of assimilation in plants, decomposing carbonic

acid and water under the action of sunlight, with the evolution of oxygen and the formation of starch or other carbon compounds. The chlorophyl pigment may be extracted from the granules by alcohol and other solvents, and appears when dry as a green resin-like powder. In solution it may be separated into two portions, one of a yellow color (xanthophyl), the other blue or greenish-blue (cyanophyl, or phyllocyanin). The change of color in leaves in autumn is due to the breaking up and various transformation of this pigment. In the etiolation or blanching of plants by exclusion of light the chlorophyl granules lose their color and finally become merged in the protoplasm, from which they are again developed by exposure to light and warmth. See also cut under Paramecium.

chlorophyllaceous (klo/ro-fi-la/shius), a. chlorophyl + -accous.] 1. In bot., of the nature of or containing chlorophyl.—2. In zoöl., having green endochrome: as, the chlorophylluceous series of infusorians. S. Kent.

Also chlorophylliferous, chlorophylligerous,

chlorophyllan (klö-rō-fil'an), n. [<chlorophyl + -an.] In bot., a substance obtained in the form of green crystals by the evaporation of a purified solution of chlorophyl pigment in alcohol. chlorophyllian (klō-rō-fil'i-an), a. choanocyte (kō'a-nō-sīt), n. [ζ Gr. χοάνη, a funnel (see choana), + κύτος, a cavity, a cell.]
One of the collared and flagellated monadiform cells of sponges: so called from their great resemblance to choanoflagellate infusorians. Such cells form layers lining the flagellated endodermal chambers of sponges.

Such cells form layers lining the flagellated endodermal chambers of sponges.

In tetractinellida, and probably in many other sponges — certainly in some—the collars of contiguous choanocytes coalesce at their margins so as to produce a fenestrated membrane, which forms a second inner lining to the flagellated chamber. Encyc. Brit., XXII. 418.

Choanoflagellata (kō"a-nō-flaj-e-lā'tā), n. pl. [NL. (H. James Clark, 1871), neut. pl. of choanoflagellatus: see choanoflagellate.] The collarbearing flagellate infusorians; a group or order of animalcules, exceedingly minute, highly variable in form, but usually exhibiting in their most normal and characteristic phase a symmetrically ovate, pyriform, or clavate outline. A single long lash-like flagellum is produced from the center of the anterior border, the base of which is embraced by a delicate hyaline, extensite and retractile, collar-like expansion of the body-sarcode. The collar in its extended condition is infundibuliform or wineglass-shaped, and when contracted is subcylindrical or conical, exhibiting in its expanded state a distinct circulating current or cyclosis of its finely granular substance. The incenter area is discoidal, food-substances being brought in contact with the expanded collar through the vibratory action of the flagellum. They are first carried up the outside and then down the inside of this structure with the circular integrated at any point within the same discoidal space. These animalcules have a distinct spheroidal endoplast,

with a contained endoplastule and two or more contractile vesicles, usually conspicuous. They inhabit salt and fresh water, and increase by longitudinal or transverse fission, and by encystment and subdivision of the entire body into sporular elements. The principal genera are Codosiga, Codomæca, Salpingæca, Dinobryon, and Autophysa. Also called Flagellata discostomata, and by Diesing Trichosomata.

choanoflagellate (kõ″a-nō-flaj'e-lāt), a. [⟨NL. choanoflugellatus, < choana, q. v., + flagellatus:

choanosomal (kō"a-nō-sō'mal), a. [< choanosome + -ul.] Of or pertaining to the choanosome of a sponge; characterized by the presence of choanocytes, as a subdermal part of the body of a sponge.

Lipogastrosis . . . may be produced by the growing together of the roots of the choanosomal folds, thus reducing the paragastric cavity to a labyrinth of canals, which may easily be confounded with the usual form of exeurrent canals.

Energe, Brit., XXII, 416.

**choanosome** (kō'a-nō-sōm), n. [ $\langle$  Gr.  $\chi$ oáv $\eta$ , a funnel (see *choana*),  $+ \sigma \tilde{\omega} \mu a$ , body.] The inner part or region of the body of a sponge which is characterized by the presence of flagellated chambers or cavities lined with a layer of choanocytes; the choanocytal portion of a sponge.

With the appearance of subdermal chambers the sponge becomes differentiated into two almost independent regions, an outer or ectosome and an inner or choanosome, which is characterized by the presence of fingellated chambers.

Encyc. Brit., XXII. 415.

In the ruins of Flaviopolis, in Phrygia, has been found a marble block having cylindrical wells marked with the names of different Greek measures. Of these the chemix appears to have contained 1.5 liters. This seems to have been about the capacity of the Æginetan, Bootian, and Pontie measures. The Attic chemix, however, according to various approximative statements of the relation of Attic to Roman measures, must have contained about 1 liter, or half a Babylonian kab; and this is probably the measure mentioned in the New Testament (Rev. vi. 6). In Egypt the Ptolemaic system had a chamix, which appears to have equaled 0.8 liter. The chemix of Heraclea in Italy is surmised to have been 0.7 liter.

Chondrostei (kon-dros 'tē-ī), n. pl. [NL., pl. of chondrosteus: see chondrosteus.] 1. In Müller's system of classification (1845), an order of ganoid fishes, characterized by the skeleton being partly cartilaginous, partly bony, and the skin naked or provided with osseons bucklers.—2. In Cope's system of classification of lers.—2. In Cope's system of elassification, a primary division of aetinopterous fishes, with an entire series of basilar segments of the ab-dominal ventral fins, and with no branchioste-gal rays and no pterotic bone: synonymous with Chondroganoidea.

Chondrosteidæ (kon-dros-tē'i-dē), n. pl. [NL., \( Chondrosteus + -ida. \) A family of fossil chondrosteous fishes, represented by the genus Chondrosteus.

Chondrosteosaurus (kon-dros"tē-ō-sâ'rus), n. [NL.,  $\langle$  Gr.  $\chi \delta v \delta \rho o c$ , cartilage, +  $\delta \sigma \tau \delta o v$ , bone, +  $\sigma a \bar{\nu} \rho o c$ , lizard.] A genns of fossil dinosaurian reptiles of eolossal size, from the Creta-

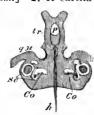

ceous strata of Europe and America.

chondrosteous (kon-dros' tē-us), α. [< NL. chondrosteus, < Gr. χόνδρος, cartilage, + ἐστέον, bone.] Having a cartilaginous skeleton, as a sturgeon or other member of the Chondrostei.

Chondrosteus (kon-dros'tē-us), n. [NL. (Agassiz, 1843): see chondrosteous.] A genus of fossil sturgeon-like fishes, made the type of a sep-

arate family Chondrosteidæ.

Chondrostoma (kon-dros'tō-mä), n. [NL. (Agassiz, 1837), < Gr. χόνδρος, eartilage, + στόμα,

Chondrocranium, or Car-tilaginous Skull of Chick, 6th day of incubation.

chondrotome (kon'drō-tōm), n. [⟨ Gr. χόνδρος, cartilage, + τομός, verbal adj. of τέμνειν, cut: see anatomy.] In surg., a knife specially adapted for cutting cartilages. It is a stont, strong kind of scalpel, with the blade and file-like handle usually of steel and in one plece. Also called cartilage-knife. chondrotomy (kon-drot'ō-mi), n. [= F. chondrotomie = Sp. condrotomia, ⟨ Gr. χόνδρος, cartilage, + τομή, a cutting: see anatomy.] 1. In surg., the cutting of a cartilage.—2. In anat., a dissection of cartilages.

chondrule (kon'dröl), n. [⟨ NL. \*chondrulus, dim. of chondrus, cartilage: see chondrus.] A term proposed as an English equivalent of chondrus, 1.

chondrus, 1.
chondrus (kon'drus), n.; pl. chondri (-drī).
[NL., < Gr. χόνδρος, groats, grain, lump, eartilage, gristle.] 1. A rounded mass, or spherule, consisting of a single crystal of some mineral, or of an aggregate of several crystalline fragments of different minerals, often more or less ments of uniferent minerals, often more or less mingled with a glassy base. Such forms are found in various meteorites, sometimes constituting nearly the whole of the mass, sometimes only a small portion of it. This peculiar structure is designated as chondritic, and each individual spherule as a chondrus. Such chondriare usually smaller than a pea. They are generally considered to be drops of matter solidified from a molten condition.

2. A cartilage, particularly the ensiform eartilage. Also spelled *chondros.*—3. [cap.] In bot., a genus of seaweeds, including the *Chondrus*. a genus or seaweeds, including the Chondrus crispus (Irish moss or carrageen), which furnishes a nutritious gelatinous matter.—4. [cap.] In zoöl., a genus of pupiform gastropods. Cuvicr, 1817. chone (kōn), n. [NL.,  $\langle$  Gr.  $\chi \omega \nu \eta$ , contr. of  $\chi \circ \dot{\alpha} \nu \eta$ , a funnel: see choana.] The cortical dome of a spouge. See extract.

In many sponges the cortical domes are constricted near their communication with the subdermal cavity by a transverse muscular sphincter, which defines an outer division or ectochone from an inner or endochone, the whole structure being a chone.

Syn. 1. Choose, Prefer, Elect, Select, fix upon, pitch upon, adopt. Choose is the most general of these words, but always represents an act of the will; it is the taking of one or some where all are not wanted or cannot be had. Choice may be founded upon preference or modified by necessity. Prefer represents a verdict of the judgment or a state of the inclination; it emphasizes more than does choose the leaving of the rest: he who prefers apples to oranges will choose apples when he has the opportunity of choic; one may by inclination prefer to work at night, but, on grounds of health, choose to work only by day. Elect has an exact nee in theology; its principal use otherwise is to express the choice of persons, by ballot or otherwise, for office, memberahip in societies, etc.: as, to be elected alderman or treasurer; to elect certain studies in a college is to choose them formally. Select represents a careful, discriminating choice.

A major chord is one having a major third and a perfect fifth; a minor chord, one having a minor third and a perfect fifth; a minor chord, one having a minor third and a diminished fifth; and an augmented chord, one having a major third and an augmented fifth. Diminished and augmented chords are also called anomalous. A chord of the seventh, or seventh-chord, consists of any tone with its third, fifth, and seventh; a chord of the ninth contains also the ninth. (See ninth.) The tones of a chord are arranged for analysis at intervals of a third from one another; and when so arranged, the lowest tone is called the root of the chord. When all the tones of the chord are mornanged, the lowest the chord when so arranged the lowest tone is called the so arranged that the root is not the lowest, the chord is inverted. Inverted chords are known by the numerals indipresent, it is imperfect or incomplete; when the tones are so arranged that the root is not the lowest, the chord is inverted. Inverted chords are known by the numerals indicating the intervals between the lowest one and the others: as, chords of the sixth, of the fourth and sixth, of the fifth and sixth, of the second, etc. The tonic or fundamental chord is the triad whose root is the tonic or key-note; the dominant or leading chord, that whose root is the dominant (fifth tone of the scale); the subdominant chord, that whose root is the subdominant (fourth tone of the scale), etc. Chords are related or relative to each other when they conclude two keys or tonalities, and containing tones foreign to both. An equivocal chord is one which may be resolved into different keys without changing any of its tones. Hence—5. Harmony, as of color.

chromiometer (krō-ini-om'e-ter), n. [Irreg. ζ Gr. χρωμα, color, + μέτρον, ineasure.] An apparatus for testing water by its optical purity, consisting essentially of a glass tube filled with water, through which light is seen by reflection. water, through which light is seen by reflection. chromion (krō'mi-on), n. Samo as chromium. Chromis (krō'mis), n. [NL., < L. chromis, < Gr. χρόμς, a kind of sea-fish.] A genus of fishes, typical of the family Chromidæ, or referred to the family Cichlidæ. (a) Originally instituted by Cuvler in 1817, for the Mediterranean C. castanea. It was thus identical with the genus afterward called Heliases, and a representative of the family Pomaceatridæ. (b) Subsequently extended to embrace also sundry African and South American fresh-water fishes. (c) It was later restricted to certain African species, of which the bolti is one. It has been used in this sense by most modern ichthyologists, and taken as a type of a family Chromidæ or Chromidæs; luit others properly restrict the name to the original type and its congeners, belonging to the family Pomacentridæ, accepting the name Tilapia for the African forms, and referring the latter genus to the family Cichlidæ. chromism (krō'mixm), n. chromium (krō'mi-um), n. [NL. (from the beautiful colors of its compounds), ⟨ Gr. χρῶμα, color, +-ium.] Chemical symbol, Cr; atomic weight, 52.3; specific gravity, 6.8-7.3. An element belonging to the metals, obtained in the pure state as a light-green crystalline powder. The separate crystals under the microscope have a tin-white color. It is less fasible than platinum, and after fusion is harder than corundum. It oxidizes slowly in the air, but burns vividly in oxygen. Hot hydrochloric or sulphuric acid dissolves it; nitric acid does not aftect it. Chromium does not occur native. It is found in the mineral crocoite or crocoisite (lead chromate), and as a sulphid in daubreellte; it occurs also in some meteoric iron, and the fine green color which makes the emersal valusble is believed to be due to chromium; but the most shundant ore of chromium is chromite or chrome-ironstone. Among its most important compounds are the oxid or sequioxid (Cr₂O₃), which occurs native in chrome-ocher and chromite. It is a dull-green powder when made artificially by reduction of the chromates, and is used extensively for imparting a green color to porcelsin and enamel, and somewhat as a pigment, in the form of chromic oxid, under the name of Guignet's green. Potassium bichromate (K₂Cr₂O₂) is the salt from which most salts of chromium are prepared. It forms garnet-red crystals, which dissolve in water, making a red solution. It is largely used in dycing and calico-printing and as an oxidizing agent; also in the carbon or other processes of photographic printing, and in a form of voltaic cell called the hichromate cell. See cell, 8. It is an active poison.—

Transparent oxid of chromium, a pigment used hy artists, composed of a hydrated oxid of chromium. It differs but little from Guignet's green.

in the representation of flowers is already secured by the chromo-lithographic process. Pop. Sci. Mo., XIII. 502. chromolithography (krō\*mō-li-thogʻra-fi), m. [⟨Gr. χρῶμα, color, + lithography.] A method of producing colored lithographic pictures by the use of a number of prepared lithographic stones. The general outline and the ontline of each of the tints in the picture to be reproduced are first traced, and then transferred to the first stone, or keystone, by the ordinary methods of lithography, or the design is drawn directly on the keystone. For the coarser kinds of color-printing the ontlines of the design are made upon zinc plates with pen or brush, and thence transferred to the stone. From the keystone, which bears the skeleton design, the outlines of each that are separately transferred to as many other stones as there are colors in the picture, sometimes as many as forty. The first impression, taken by the printer from the keystone, gives the outlines of the picture, the second, taken from another stone, all the yellow tints, the third all the reds, and so on until all the colors needed are given. Before each successive impression the sheets are adjusted to a nicety, in order that the colors may not overlap one another. This adjustment is called the register. After the printing is completed the sheets are sometimes passed through an embossing-press, to give them a canvas-like surface.

chromophan (krō'mō-fan), m. [⟨ Gr. χρῶμα, color, + φαίνειν (√\*φαν), appear.] The coloring matter of the inner segments of the cones of the retina of certain animals. Three varieties have been described, chlorophan, rhodophan and vanthophan.

of the retina of certain animals. Three varieties have been described, chlorophan, rhodophan, and xanthophan.

chromophilous (krō-mof'i-lus), a. chronogram (kron'ō-gram), n. [= F. chronogramme, < Gr. χρόνος, time, + γρόμμα, a letter or writing, < γράφειν, write. Cf. chronograph.]

An inscription in which a certain date or epoch is expressed by the numeral letters contained is expressed by the numeral returns contained in it, each letter being counted according to its independent value, as in the motto of a medal struck by Gustavus Adolphus in 1632: "ChristVs DVX; ergo trIVMphVs" (C + I + V + D + V + X + I + V + M + V - that is, 100 + I + 5 + 500 + 5 + 10 + 1 + 5 + 1000 + 5 = 1632).

There is another near relation of the anarsms and acrostics, which is commonly called a chronogram. This kind of wit appears very often on many modern medals, especially those of Germany, when they represent in the inscription the year in which they were coined.

chronograph (kron'ō-gráf), n. [⟨ Gr. χρονογράφος, recording events (see chronography), lit. recording time, ⟨ χρόνος, time, + γράφεν, write.] I. A chronogram.—2. An instrument for recording the exact instant in which an event occurs. The most important instrument of this kind is the astronomical chronograph, the parts of which are: (a) a train of clockwork, regulated, not by an ordinary escapement, but in such a way as to move with a continuous and equable motion, and carry forward a sheet or ribbon of paper; (b) a pen which draws a continuous line upon the paper, and is so attached to the armature of an electromagnet that whenever the electric current is broken (or made) for an instant a jog is produced in the line drawn by the pen. The electromagnet is put into one circuit with a clock or chronograph which breaks (or makes) the circuit for an instant at every second, or other convenient interval, and also with an observing-key, which on being pressed (at the moment the observation is taken) produces the same effect. The result is that jogs appear upon the line drawn by the pen at every second, and also every time the key is touched; and the relative distances of these jogs, which can be accurately measured, give the time of the observation correct to a fiftieth of a second. The name chronograph is also applied to various kinds of watches so contrived that when a button is pressed the second-hand stops, or one of two second-hands atops, or the aecond-hand leaves a dot of ink upon the dial.

3. An instrument for measuring a small interval of time. The simplext interval of the produces the second-hand stops, or one of two second-hands to the second-hand stops, or the aecond-hand leaves a dot of ink upon the dial.

3. An instrument for measuring a small interval of time. The simplest instrument of this description consists of a tuning-fork carrying at the end of one of its prongs a bit of quill, which scratches a wavy line upon a moving piece of blackened paper. At the beginning and at the end of the interval to be measured an induction-spark is made to pass through the paper close to the marking-point. Two little dots are thus made, and the number of waves and fractions of a wave between them gives the interval of time expressed in terms of the period of vibration of the fork as a unit.—Boulengé's chronograph, an instrument by means of which a small interval of time is determined by measuring the space described by a falling body during the interval. feet state; specifically, the pupa of a butterfly. In the chrysalls form the animal is in a state of rest or insensibility, and exists without nutriment for a length of time varying with the species and season. During this period an elaboration is going on in the interior of the chrysalis, giving to the organs of the future animal their proper development before it breaks its envelop.

Chrysalis

The form of the case of the chrysalis varies with different families and erders. Those of most iepidopterous insects are inclosed in a somewhat horny membranens case, and generally of a more or less angular form, pointed at the abdominal end and sometimes at both ends. Before the eaterpillar undergoes its transformation into this state it often spins for itself a silken cocoon, within which the chrysalis is concealed. In most of the Coleoptera the legs of the chrysalis are in distinct sheaths; in the Lepidoptera they are not distinct; in the locust tribe, and many other insects, the chrysalis resembles the perfect insect, and differs from the latter principally in not having the wings complete. Composed of gold and ivory: specifically, in ancient art, applied to statues overlaid with plates of gold and ivory. Such a statue was built up upon a wooden core or frame, braced and sustained by rods of metal. When the sculptor had completed his model, the flesh-surface of a cast taken from it was marked off into sections. These were separated from one another, and reproduced in ivory plates, which were eventually fastened on or fitted into the surface of the wooden core. The draperies also were divided into sections and reproduced in gold, gold of different tints often being introduced, and were fitted upon the statue like a garment. The gold por-

tions were sometimes made removable, as in the great statue of Athena by Phidias in the Parthenon at Athens; in that case they were regarded as a reserve fund available to the state in time of need.

The proportions of the whole building [the Parthenon] itself were again adjusted to the scale of the chrysele-phantine statue of Pallas Athene which it contained.

10. By extension, some religious body not Christian, especially the Jewish: as, the Jewish

This is he that was in the church in the wilderness with the angel which spake to him in the mount Sina.

Acts vii. 38.

Acts vii. 38. [What constitutes a Christian church according to the Scriptures is a question on which Christian denominations widely differ. The three principal views may be distinguished as the Roman Catholic, the Protestant coclesiastical, and the voluntary. According to Roman Catholic theologians, the church is a visible and organic body, divinely constituted, possessing "Unity, Visibility, Indefectibility, Succession from the Apostles, Universality, and Sanctity" (Faith of Catholics, I. 9), and united to its visible head on earth, the Bishop of Rome. According to the Anglican and Protestant ecclesiastical view, the church of Christ is "a permanent visible society" (Wordsworth on Mat. xvi. 18), divinely compacted, governed, and equipped, and having definite ends, a definite policy, and a historic continuity. (The Church Cyc.) According to the voluntary conception, a church is a society of persons professing faith in the Lord Jesus Christ as the Son of God and the Saviour of men, and organized in allegiance to him for Christian work and worship, including the administration of the sacraments which he has appointed. (R. W. Dale, Manal of Congr. Principles, Comp. West. Conf., xxxv.; Thirty-nine Art., xix.) A strong ale of good quality brewed especially for a church festival, and broached only on the day of the feast in question.—2. A convivial meeting on the occasion of a church festival, at which the ale specially brewed was served.

The Church-ales, called also Easter-ales, and Whitsun-ales, from their being sometimes held on Easter-Sunday, and on Whit-Sunday, or on some of the holidaya that fol-low'd them, certainly originated from the wakes. Strutt, Sports and Pastimes, p. 471.

For the church-ale two young men of the parish are yearly chosen by their last foregoers to be wardens, who, dividing the task, make collection among the parishioners of whatsoever provision it pleaseth them voluntarily to

bestow. This they employ in brewing, baking, and other acates, against Whitsuntide, upon which holidays the neighbours meet at the church-house, and there merrily feed on their own victuals, contributing some petty portion to the sbock, which by many smalls groweth to a meetly greatness: for there is entertained a kind of emulation between these wardens, who, by his graciousness in gathering, and good husbandry in expending, can best advance the church's profit.

purposes of business or entertainment.

No one until quite recently seems to have been aware that the church-house was a building which, if not always, was at least commonly attached to the parish church. Its uses were varied; indeed, it would seem to have been the public room of the parish, which could, with the consent of the churchwardens, be used for any purpose that the needs of the parish rendered necessary. One function it discharged, and that pretty frequently, was that of a hall in which the church-nles could be held.

Churchwardens are appointed by the minister, or elected by the parishioners, to superintend the church, its property and concerns, to enforce proper and orderly behavior during divine service, and in England to fix the church-rates. For these and many other purposes, Including in England some of a strictly secular character, they possess corporate powers. There are nsually two churchwardens to each parish, but by custom there may be only one. By a cason of the Church of England, Joint consent of minister and parish should attend the choice of churchwardens. If they cannot sgree, the minister names one and the parishioners the other. In some cases the parish has a right by custom to choose both. In the United States churchwardens are always elected, but have duties similar to the above. In colonial times, in most of the middle and southern colonies, they had civil duties in connection with the local government of the parish.

Ciliata (sil-i-ā'tä), n. pl. [NL., neut. pl. of ciliatus, having cilia: see ciliate.] 1. The ciliated infusorians; a major group of Infusoria, as distinguished from the Flagellata and the Tentaculijera, characterized by the possession of organs of locomotion and prehension in the

Tentaculifora, characterized by the possession of organs of locomotion and prehension in the shape of numerous vibratile cilia, more or less completely clothing the body. The cilia are variously modified as setæ, styles, or uncini, and membraniform expansions are occasionally found: but the Ciliata are devoid of the special supplementary lash-like appendages called flagella. They are usually unsymmetrical animals of a high grade of organization in their class, the simplest of them being differentiated luto an endosarc and ectosarc with an endoplastule and contractile vacuole, while most, if not all, show an oral region where food is ingested, whence an esophageal depression leads into the eudosarc; and there is also, usually, an aboral or anal area through which the refuse of digestion is evacuated. The families are numerous, and have been divided by Stein Into the groups Holotricha, Heterotricha, Hypotricha, and Peritricha, according to the character of the cilia and their disposition upon the body of the animal. Paramecium and Vorticella are common examples of the Ciliata.

They are the source of Peruvian or cinchona bark and of quinine. There are about 40 species, but the cinchona barks of commerce are produced by about a dozen. The barks used in pharmacy are chiefly of three kinds: loxa, crown, or pale cinchona bark, the ordinary Peruvian bark, afforded by C. oficinalis; calisaya or

yellow cinchona bark, from C. Calisaya; and red cinchona bark, from C. succirubra. Several other barks are used exclusively in the mannfacture of quinine, as the Colom-

lian or Cartagena bark, from C. lancifolia and C. cordifolia; Pitayo bark, from C. Pitayensis; gray, Lima, or Huanuco bark, from C. Peruviana and other species; and Cusco bark, from C. pubescens. The British and Dutch governments have done much to promote the cultivation of the more important species, and extensive plantations have been successfully established in the Himalayas and in Ceylon, Java, and Jamaica. Cinchona bark is most valuable as a remedy in fevers and as a general tonic; but the alkaloids obtainable from the bark have in practice largely taken the place of the bark itself. Of these the most abundant and the one in most common use is quinine. Others equally valuable are quinadin, cinchonine, and cinchonidine. The amount of alkaloids yielded by the bark is very variable, from a very small percentage to as much as 12 percent., of which from one third to three fourths is quinine. 2. A tree of the ge-nus Cinnamomum, especially C. Zeylunicum. This

tree is cultivated for its bark in Ceylon, Sumatra, and Borneo, and on the Malabar coast. It is sometimes confounded with *C. Cassia*, which yields the Chinese cinnamon or common cassia-lignea (which see).

2. The inner bark of *Cinnamomum Zeylanicum*.

2. The inner bark of Cunamomum Zeytanicum. It is stripped from the branches, and in drying takes the form of rolls called quills, the smaller quills being introduced as they are drying into the larger ones. The true cinnamon is a grateful aromatic, of a fragrant smell and moderately pungent taste, accompanied with some degree of sweetness and astringency. It is used in medicine for its cordial and carminative properties, and is one of the best restorative spices. The bark of C. Cassia, being cheaper, is often substituted for true cinnamon, but it is thicker, coarser, and less delicate in flavor.

In Rom. antiq., a large, oblong, roofless inclosure, used especially for horse- and chariot-races. It was rounded at one end, and had at the other the barriers or starting-places for the horses. The course passed round a low central wall, called the spina, which reached nearly from end to end, and was surrounded by tiers of seats rising one above another for the accommodation of the spectators. It was essentially an adaptation of the Greek hippodrome, but was used also, like the amphitheater, for gladiatorial contests, combats with wild beasts, etc.

Citcaux (see def.).] A member of an order of monks and nuns which takes its name from the circulal convent Citcaux (Cistercium) near its original convent, Cîteaux (Cistereium), near Dijon, in France, where the society was founded in 1098 by Robert, abbot of Molesme, under the rule of St. Benedict. They led a contemplative and very ascetic life, and, having emancipated themselves from the oversight of the bishops, formed a sort of religious republic, under the government of a high council of twenty-five members, the abbot of Citeaux being president. St. Bernard, abbot of Citairvaux (founded 1115), was the most celebrated member of the order, and is regarded as its second founder. Its discipline was afterward greatly relaxed, and several times reformed. From the Cisterians emanated the barefooted monks or Feuillants in France, the nuns of Port-Royal, and the monks of La Trappe. The French revolution reduced the Cistercians to a few convents in Belgium, Austria, Poland, and the Saxon part of Upper Lusatia. They wear a white cassock with a black scapular, but when officiating are clothed with a large white gown, with great sleeves and a hood of the same color. The Cistercians have abbeys in the United States at Gethsemane in Kentucky, and near Dubnque in Lowa. its original convent, Cîteaux (Cistereium), near

All inhabitants within these walls are not properly citizens, but only such as are called freemen.

Sir W. Raleigh, Ilist. World.

2. Any inhabitant of a city or town, as opposed to an inhabitant of a rural district; a towns--3. In a restricted sense, a person engaged in trade, as opposed to a person of birth and breeding.

Sweep on, you fat and greasy citizens;
Tis just the fashion: wherefore do you look
Upon that poor and broken bankrupt there?
Shak., As you Like it, ii. 1.

A member of the state or nation; one bound to the state by the reciprocal obligation of allegiance on the one hand and protection on the to the state by the reciprocal obligation of allegiance on the one hand and protection on the other. Persons of the following classes are citizens of the United States: (1) Persons born in the United States and not subject to any foreign power (except untaxed Indiana). This includes children of alien parents other than those of foreign ambassadors, etc. (2) Children born elsewhere to fathers who were, at the time of their birth, citizens at some time resident in the United States. (3) Naturalized persons, including some in effect naturalized by treaty, etc. (4) Women (though not bern here nor naturalized) if not incapable of naturalization, and married to citizens. (5) Freedmen under the act of emancipation. (6) Indians born within the United States who have withdrawn from the tribal relation, entered civilized life, and are taxed. (7) Indians who have accepted lands allotted in severalty under the Dawes Bill (1887); but there may be a question whether they practically become citizens before their reservation is thrown open. A person may be a citizen of the United States without being a citizen of any particular State, as, for instance, an inhabitant of the District of Columbia. The two citizenships are distinct in legal contemplation, although one is usually held by any person who helds the other; and practically, as a general rule, eitizenship in a State consists of eltizenship of the United States plus a domicile (that is, a fixed abode) in the State. The right to vote or hold office is not a teat of citizenship, for minors and women are commonly citizens without those rights, and there are cases where aliens may hold office. All persons bern or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the state wherein they reside. Comst. of U. S., 14th Amendment.

5. A private porson, as opposed to a civil official or a soldier: as, a police officer in citizen's cial or a soldier: as, a police officer in citizen's dress.—Natural-born citizen, one who is a member of a state or nation by virtue of birth. Whether it is necessary to this that the father should be a citizen is disputed; those jurists who follow the doctrine of national character prevailing in continental Europe hold that it is, American jurists generally hold that it is not. The English courts, while helding that a child born within the allegiance and jurisdiction is a natural-born British subject irrespective of allen parentage, held also, after much conflict of opinion, and in disregard of abstract consistency, that a child born in a foreign country of British parents was also a natural-born British subject. The American rule is that a child born and remaining within the exclusive jurisdiction of the United States is a citizen, and within its allegiance and protection, irrespective of the birth or nationality of its parents.—Naturalized citizen, one of foreign birth who has become a citizen by adoption or naturalization, as distinguished from a native-born or naturalization. Having the qualities of a citizen;

born citizen.

I, n.; pl. cities (-iz).
I. A large and important town; any large town holding an important potown; any large town holding an important position in the state in which it is situated. In the United States a city is properly an incorporated municipality, usually governed by a mayor, aldermen, and common council. The number of inhabitants required to constitute actly is commonly over 10,000; but it differs greatly in different States, some (especially in the west) having incorporated cities of fewer than 3,000 inhabitants. In Great Britain the term is applied in a narrower sense to a town corporate which is or has been the seat of a bishop and of a cathedral church. The word is often used, like town, in opposition to country.

And who so had be thence a myle or twayn, Vppon the feld to loke or cast his le, It shuld hym seme a town or a Citee.

the east, and Hebron, Shechem, and Kadesh on the west,
(b) Medina in Arabia, where Mohammed took refuge when
driven by conspirators from Meeca, his native city, A. D.
622.—Free city or town, a city or town having its own
government and laws, independently of the country with
whose territory it is immediately connected—that is, forming a state by itself. The towns of the Hanseatic league in
Germany and northern Europe, in the middle ages, were
generally free; some of those in Germany were also called
imperial cities, as members of the German empire. The
only free cities remaining are Hamburg, Lübeck, and Bremen, which since 1871 have been sovereign members of the
present German empire. Frankfort-on-the-Main was a
free city till 1866, when it was annexed to Prussla.—Holy
city. See koly.—The City of London, that part of

London, the metropolis of England, which constituted the original city. It lies on the north bank of the Thames, extending from Temple Bar on the west to the Tower on the east, and as far north as Finsbury. It covers an area of 668 acres, constitutes a county in itself (see county), and is governed by a lord mayor, elected by the trade guilds, 26 aldermen holding office for life, elected by the wards, and a common council of 206 members. The great business and commercial interests of London are chiefly centered in this district.

A race; a family; a tribe; an association of persons under a chieftain; especially, such a family or tribe among the Highlanders of Scotland. The clanks a tribat form of scotland and tribe to the clandary of scotland. such a family or tribo among the Highlanders of Scotland. The clan is a tribal form of social and political organization based upon kinship of the members. The chief features of the system are (1) the leadership of a chief, regarded as representing a common ancestor, and (2) the possession of land partly undivided as the common demain of the clan, and partly divided as the separate property of its members and their heirs, the clan being the heir of a member who dies leaving no son. It prevailed in early times in Germany and Ireland, and until recently in Scotland, and to some extent in other countries. Thus, among the Highlanders a clan consisted of the common descendants of the same progenitor, under the patriarchal control of a chief, who represented the common ancestor, and who was revered and served by the clansmen with the blind devotion of children. The clana did not, however, acknowledge the principle of primogeniture, often raising to the chiefship a brother or an uncle of a decessed chief. The name of the clan was generally that of the original progenitor with the prefix Mac (son). There are few traces of this institution now remaining.

We are by our occupations, education, and habits of life divided almost into different species. Each of these classes of the human race has desires, fears, and conversation, vex-ations and merriment peculiar to itself.

Nine tenths of the whole people belong to the laborious, industrious, and productive elasses.

D. Webster, Speech, Pittsburg, July, 1833.

The constitution of the House of Commons tended greatly to promote the salutary intermixture of classes. The knight of the shire was the connecting link hetween the baron and the shopkeeper. Macautay, Hist. Eng., i.

3. Any body of persons grouped together by particular eirenumstances or for particular reasons. Specifically—(a) A number of pupils in a school, or of students in a college, of the same grade or pursuing the same studies; especially, in American colleges, the students collectively who are graduated, or in accordance with the rules of the college will be graduated, in the same year. There are four college classes, the treshman or lowest, the sophomore, the junior, and the senior. The word was first used in this sense in American colleges in the Latin form classis, and was borrowed from the universities of continental Europe, where it had during the sixteenth century replaced the incideval lectio. (b) In the Meth. Ch., one of several small companies, usually numbering about twelve members, into which each society is divided, for more effective pastoral oversight, social meeting for religious purposes, and the raising of money for church work. It ordinarily holds a weekly session called a classimeeting, under the charge of one of the members called a classical edger, whose duty it is to see every member of his class at least once a week; to give religious instruction, reproof, or comfort, as needed; to receive for the stewards of the church the contributions of the class for the support of the church; to report to the pastor any numbers needing especial attention, as the sick, backsliders, etc.; and to report ou the condition of his class to each Quarterly Conference. (c) Same as classis, 2. (d) In several European states, one of the graded divisions of primary electors for members of the legislative body. In Prussia the whole number of voters is divided into three classes, so arranged that each class pays one third of the direct tax levied. The first class is of the few wealthy, who pay the highest taxes, to the amount of one third of the whole. Each class chooses the same number of secondary electors, who elect the deputies.

4. A number of objects distinguished by common characters from all others, and regarded as a collective unit or group; a collection eapable of a general definition; a kind. A naturated class is a set of objects possessing important characters over and above those that are necessary for distinguishing them from others; but the term is applied by naturalists to groups which want this character, and which have not generally retained very long, unchanged, a place in science. See classification.

There is not a more singular character in the world than that of a thinking man. It is not merely having a succession of ideas which lightly skim over the mind that can with any propriety be styled by that denomination. It is observing them separately and distinctly, and ranging them under their respective classes.

Melmoth, Letters of Fitzosborne.

the class. Read, Intellectual Powers, v. § 2. (This meaning came into use about the middle of the eighteenth century. The phrase to be included under a class' is older than to be included in a class. So In nat. hist., a group of plants or animals next in rank above the order or superorder, and commonly formed by the union of several condess or superorders. orders or superorders: but it may be represented by a single species. See classification. In zoölogy the class was the highest division of the animal kingdom in the Linnean system, when the word first acquired its technical zoölogical meaning. Linnean arranged animals in six classes: Mammalia, Aves, Amphibia, Pisces, Insecta, Vermes; the next groups below class

were the orders. In the Cuvierian system a class was the first division of one of the four "great divisions" of the animal kingdom, Vertebrata, Mollusca, Articulata, and Radiata; thus Cuvier'a four classes of Vertebrata were Mammalia, Aves, Reptilia, and Pisces. There are now recognized seven or eight subkingdoms or phyla of animals, divided into about thirty-five classes (see animal kingdom, under animal); the class being the division usually recognized next below the phylmm or aubkingdom, though some naturalists introduce a superclass, or division between the phylum and the class, as Ichthyopsida for the classes Pisces and Amphibia, or Sauropsida for the classes Aves and Reptilia. The class is always superior to the auperorder, order, or suborder, and inferior to the kingdom, subkingdom, or phylum. In botany, likewise, the class is the next principal grade of divisions above the order, and in the Linnean system was the highest grade. The aubclass, division, and cohort or alliance are, however, often variously intercalated as subordinate groupings between the class and the order. The phænogamic series or subkingdom of plants includea the three classes of gymnosperms (often united with the next), dioctyledons, and monocotyledons. The cryptogamic aeries has been ordinarily divided into the two classes of acrogens and thallogens; by recent authorities the number has been increased by three or four or more.

6. In geom., the degree of a locus of planes; a division of algebraical loci bearing an ordinal number showing how many planes there are

division of algebraical loci bearing an ordinal number showing how many planes there are incident to the locus and passing through each incident to the locus and passing through each line of space. In the case of a plane locus, this is the number of lines in the plane incident to the locus and passing through each point in the plane. The ordinal number of the class of an algebraical surface is the number of tangent planes to the surface through each line of space. The class of an algebraical curve of double curvature is the number of osculating planes through each point of space; also, the class of a cone on which the curve lies. The class of an algebraical plane curve is the number of tangents attrough each point of the plane. The class of a congruence is the number of lines of the congruence passing through each point of space. The class of a complex is the class of the cone of lines of the complex passing through each point of space. classification (klás"i-fi-kā'shon), n. [=G. classification = D. klassifikatic = Dan. klassifikation = F. classification = Sp. classificacion = Pg. classificação = lt. classificazione, < NL. classificatio(n-), < classificare, classify: see classify.]

The act of forming a class or of dividing into classification the classification classification. classes; the act of grouping together those beings or things which have certain characters in common; distribution into sets, sorts, or ranks; ings or things which have certain characters in common; distribution into sets, sorts, or ranks; taxonomy. In natural history classification has been made on two principles, distinguished as the natural and the artificial; the former aiming to arrange all known plants or animals according to their resemblances, and degrees of resemblance, in the whole plan of their structure; the latter arranging them by some one or more points of resemblance or difference, as may be most convenient and easy, and without regard to other considerations. The widest divisions in zoölogy are called subkingdoms; subkingdoms are divided into phyla or classes, classes into orders, orders into families, families into genera, genera into species, and species into varieties. There are also intermediate divisions, as subclass, superorder, suborder, subfamily, etc. In botany the same divisions are used as in zoölogy, except that orders and families are identical, and the term phylum is not used. See animal kingdom, under animal, and class, 5.— Cross-classification, a classification in which the different classes are subdivided upon a common differentiating principle, so that they are not subordinated to one another. Thus, the division of the population into native and foreign, male and female, is a cross-classification. Such are the classifications of chemistry, geometry, logic, etc. Cross-classification violates a canon of Aristotelian logic.—Herarchical classification, a classification in which the ambdivisions of different classes are different, as was required by Aristotle. Such are the usual classifications of botany and zoölogy.—Quinary or quinarian classification. See quinary.

2. A distinct stipulation, condition, proviso, etc.: as, a special clause in a contract.—3. In etc.: as, a special clause in a contract.—3. In gram., one of the lesser sentences which united and modified form a compound or complex sentence. A clause differs from a phrase in containing both a subject and its predicate, while a phrase is a group of two or more words not containing both these essential elements of a simple sentence. The principal clause is that member of a complex sentence on which others, called dependent or subordinate clauses, depend. The member of a compound sentence are coordinate clauses. Principal and coordinate clauses aperated from the remainder of the sentence can by omission of connectives (conjunctions or relatives), and addition, if necessary, of words from other clauses, resume the form of simple sentences. Dependent clauses often require further changes of mood, tense, and person to become independent sentences.—Assumption clause, a clause frequently inserted in a deed of property subject to a mortgage or other debt, whereby the grantee assumes the payment of the debt in exoneration of the original debtor.—Attestation clause. Like the pianoforte, it had a keyboard and eentury. Like the planoforte, it had a keyboard and a set of strings on a horizontal frame; but the tone was produced by the pressure of a brass "tangent" raised and

held against the string, instead of by the stroke of a ham-mer. This method of tone-production permitted consider-able variation in force and in quality. The compass of the clavichord was originally limited to a few tones in diatonic succession, and the advance to a full chromatic scale was made gradually. Tuning in equal temperament was not established until toward the middle of the eighteenth cen-tury.

I. n. I. The material resulting from the decomposition and consequent hydration of the feldspathic rocks, especially granite and gueiss. 1. n. 1. The material resulting from the decomposition and consequent hydration of the feldspathic rocks, especially granite and gueiss, and of the crystalline rocks in general. As thus formed, it almost always contains more or less sand, or silicious material, mechanically interniked. After this has been separated, the clay itself is found to consist of a hydrated silicate of alumina, but it is not yet positively made out that there is one definite combination of this kind constituting the essential basis of all the substances to which the name clay is applied. All clays contain hygroscopic water, which may be expelled by heating to 212° F.; but they also contain water in chemical combination, and when this is driven off by Ignition the clay loses its plasticity, which cannot be restored. Ordinary clay contains more or less lime and other impurities, which render it to a certain extent fusible. The purer varieties are refractory, and are known as fire-clay (which see). (See also pipe-clay, china-clay, porcelain-clay, and kaolinite.) The plasticity of clay is of great importance, as without this quality it could not be easily worked into the various shapes for which it is used. On what condition it depends has not as yet been clearly made out.

6. Manifest to the mind; comprehensible; well defined or approhended. In philosophy, as a technical term, clear is opposed to obscure, and does not imply that the idea to which it is applied is so perfectly apprehended as would be implied by the adjective distinct (opposed to indistinct or confused). These words were first used technically as applied to vision by writers on optics. Clear vision occurs where there is sufficient light; distinct vision, where the parts of the object seen can be recognized. Deseartes extended the terms to the mental apprehension of truth, which he considered analogous to vision, Leibnitz gave more technically logical definitions, especially of the term distinct (which see), and added the term adequate. 6. Manifest to the mind; comprehensible; well

Bituminous coal is mere or less distinctly stratified—that is, divided by planes parallel to the bedding of the rocks above and beneath it. It is also almost always divided into thin layers by two sets of joint-planes nearly at right angles to each other and to the bedding. Of these two sets one is usually more distinct, and this is called the cleat. The surfaces exposed in mining on the line of this cleat, which are in reality joint-planes of the coal, are called faces and backs. Called in England board.

It is chiefly the argilaceous rocks in which cleavage is highly developed, and it seems to be the result of metamorphism combined with pressure. The cleavage of roofing-slate is the best illustration of this structure. (See clay slate, under clay.) Some rocks split Into thin layers as a result of stratification, but this is not what is properly understood by cleavage. Tyndall has shown that wax may have planes of cleavage developed in it by pressure; but the only rocks in which cleavage-planes exist in perfection are those which have also undergone some metamorphism. See metamorphism.

In Rom. antiq., a person who was under the guardianship and protection of another of superior rank and influence, called his patron. The relation of client and patron between of another of superior rank and innuence, called his patron. The relation of client and pstron between a plebelan and a patrician, although at first strictly voluntary, was hereditary, the former bearing the family name of the latter, and performing various services for him and his family both in peace and war, in return for advice and support in respect to private rights and interests. Foreigners in Rome, and even allied or subject states and cities, were often clients of Roman patricians selected by them as patrons. The number of a patrician's clients, as of a baron's vassals in the middle ages, was a gage of his greatness.

The institution by which every pleheian was allowed to choose any patrician for his patron . . . made the patricians emulate each other in acts of civility and humanity to their clients, and contributed to preserve the peace and harmony of Rome.

J. Adams, Works, IV. 543.

This talent of moving the passions cannot be of any great nse in the northern climates.

Swift.

[As used by the Greeks, the word κλίμα denoted properly a slope or an incline, and was applied to mountain-slopes (κλίμα ara ὁρῶν), but especially to the apparent slope or inclination of the earth toward the pole. Hence the word came gradually to be nsed as nearly the equivalent of zone (but not of the divisions of the earth's surface now so named). A change of "climate" took place, in going north, on arriving at a place where the day was half an hour longer or shorter, according to the season, than at the point from which the start was made. The same was the meaning of the word climate as used by the carly English navigators (see def. 1). Gradually the change of temperature consequent on moving north or south came to be considered of more importance than the length of the day. Hence the word climate came finally to have the meaning now attached to it.]—Continental climate. See continental. Climate (kii'māt), v. i. [< climate, n.] To dwell; reside in a particular region. I. Properly, a loose outer garment without sleeves, worn by either sex as a protection from the weather: now frequently nsed, though erroneously, for a sleeved outer and is closed vider clom. a protection from the weather: now frequently nsed, though erroneously, for a sleeved outer wrap worn by women. In the sixteenth century the cloak was an article of every-day wear, and was made with large loose armholes, through which the sleeves of the undergarment were passed, as is seen in portraits of Henry VIII. and the nobles of his court. Later it was shortened, and became in common use little more than a cape, though large and long cloaks were still used in traveling. In the latter part of the seventeenth century cloaks were abandoned, except for protection from cold and wet, on account of the changing fashion of the outer cost. Under the name of Spanish cloak, this garment was worn from about 1800 to 1840 in Great Britain and America, the shape being a half-circle; it had a broad collar, often of fur or of velvet, which was continued down the edges of the cloak on both sides in breadths of a foot or mere. When in use, one of these edges was drawn across the breast and flung over the opposite shoulder with the breadth of fur or velvet turned outward, so as to form a decerative draping, falling from the shoulder behind. The same garment is still worn as the most common winter dress in certain Italian cities.

lief, hung in the intercolumniations of the atria of Roman dwellings, etc. Examples have been found at Pompeii and elsewhere.—2. [NL.] In entom., properly, that part of the upper surface of an insect's head which lies before the front or forehead, and behind the labrum when the latter is present; a fixed selerite immediately in front of the epieranium, and to which the labrum is attached. See cut under *Hymenop*labrum is attached. See cut under Hymenoptera. By Huxley and other anatomists the front is included in this term, being distinguished as the clypeus superior, or supraclypeus. Some of the older entomologists, notably Fabricius and Illiger, applied the term clypeus to the labrum. In Diptera it is prohably represented by the part called the hypostoma or face; but in that order the name is applied to a more or less horny fold on the upper part of the mouth, properly answering to the labrum, In the Heteroptera the clypeus is a process of the upper part of the head or crown, which in some species extends over the face. Often called the epistoma, especially when it is small or softer than the surrounding parts; also nasus and preclatum.

Prov. xxvi. 21.

If he could burn us all into one coal, We have deserv'd it. Shak., Cor., iv. 6.

A solid and more or less distinctly stratified mineral, varying in color from dark-brown to black, brittle, combustible, and used as a fuel, black, brittle, combustible, and used as a fuel, not fusible without decomposition, and very insoluble. It is the result of the transformation of organic matter, and is distinguished by its fossil origin from charcoal (def. 1), which is obtained by the direct carbonization of wood. (See coal-plant.) Coal always contains more or less earthy matter, which is left behind in the form of ash after combustion. The quantity of the ash varies considerably, but in good coal does not usually exceed from 5 to 10 per cent. In weight. Coal can, however, be used for fuel, in default of a better material, when the amount of carbon, together with hydrogen, oxygen, and nitrogen; and sulphur is rarely if ever absent. The most general subdivision of coal is into hand and soft. The former is that coal which consists almost entirely of carbon; the latter is that in which there is a considerable percentage of hydrogen. Hard coal is generally called authracite; bituminous coal, or simply coal, is the designation of the ordinary soft coal almost everywhere in general use where coal is burned, except in the eastern and Atlantic United States. In anthracite the bituminous or volatile matter constitutes usually less than 7 per cent. of the whole; in soft or bituminous coal it is usually more than 18 per cent. Coal intermediate in character between anthracite on thuminous, according as it approaches anthracite or semi-bituminous coal more nearly in character. The material driven off from coal on ignition is not really bitumen, for coal is insoluble, while bitumen its oluble. The name comes from the fact that bitumen itself does—that is, it swells up more or less, fuses together, and burns with a bright flame and considerable dense smoke. Coal occurs in all the geological formations, from the lowest in which landplants have been found (the Devonian) up to the highest; but the coal of the great manufacturing countries, England, France, Germany, and the eastern United States, is nearly all of the same geological age, and is obtained from the not fusible without decomposition, and very

were continually growing less favorable for the formation of coal on a large scale; so that each successive age has less coal to show, and that on an average of poorer quality than the coal of the true Carboniferous epoch. (See liquite.) Also called stone-coal, mineral coal, and formerly sea-coal. [Coal in this sense is used as a collective noun without a plural; but in Grest Britain the phural form is also used in speaking of a quantity of coal, with reference to the pieces composing it; as, to lay in a supply of coals; put more coals on the fire.)

coal-plant (köl'plant), n. A more or less distinctly preserved or fossilized relic of vegetation found in connection with mineral coal, and regarded as representing, or as akin with, the vegetation of which the coal itself is composed. The vegetable remains which are in the best preservation and have been most studied occur chiefly in the strata between which the beds of coal are intercalated, and especially in the under-clay or clunch by which a large proportion of them are underlain. The shaly strata overlying the coal are also very frequently found to he crowded with well-preserved forms of vegetable life. The vegetation accompanying coal varies with its geological age.
(See coal.) As the Pedeozoic or "Carboniferoas" coal ia—
in Europe and the eastern United States, at least—much
more important than that of any other geological age,
it is this coal-vegetation which has been the object of the
most careful investigation. While it is generally admitted
that the coal itself has been formed from the aggregation
and more or less complete decomposition of vegetable
matter, it is often very difficult to prove this, except by
microscopic examination, after preliminary chemical
treatment by which most of the entirely disorganized portion of the coal has been removed. Among the materials
of which the coal of different regions has been shown by
various authorities to be made up are: bark of Calamites,
Lepidodendron, and Sigillaria, spores of Lepidodendron,
vascular portions of Pecopteris and other ferns, and leaves
and bark of Cordaites. (See these words.) Vegetation of
a higher order than the Coniferæ has not yet been proved
to exist in connection with coal of Carboniferous age; by
far the larger portion of the fossil plants of that epoch belongs to the Criptogamia,

coal-tar (köl'tär), u. A thick, black, viseid, opaque liquid which condenses in the pipes when gas is distilled from coal. It is a mixture of many different liquid and solid substances, and the separation of these into useful products is now an important branch of manufacturing chemistry. Among these products may be named paraffin, naphthaliae, pitch, etc. The basic oil of coal-tar is the most abundant source of the beautiful aniline colors, their various hues being due to the oxidation of aniline by means of acids, etc. (See aniline). Coal-tar is made into asphalt for pavements, and with coaldust forms by pressure an excellent artificial fiel. It is largely used, by itself and combined with other substances to form preservative compositions for coating wood and metal. Also called gas-tar.—Coal-tar colors, a name given to a numerous class of colors derived from coal-tar by various complex chemical processes. They are more often and popularly called aniline colors, as aniline was the first of them discovered. See aniline. coal-tit (köl'tit), n. [& coal + tit]. A metal of a steel-gray color and a specific gravity variously given at from 8.52 to 8.95 and a specific gravity variously given at from 8.52 to 8.95. It closely resembles nickel, the atomic weights of the two metals being the same, and their specific gravities nearly or quite the same. They have also very nearly the same ductility and tenacity, are almost always found in intimate association, and have in many respects a marked resemblance to iron, but are less fusible than that metal, and much less magnetic. Cobalt might be, and is to a very small extent, used for the same purposes for which nickel is used, especially for plating the surface of iron; but it is much rarer than nickel, is procured with more difficulty in the metallic form, and is consequently a dearer metal. The most important ores of cobalt are cobaltite, smallitic, and linmeite. (See these words.) Cobalt ores occur in a considerable number of localities, but nowhere in large quantity. The

chief supply of the cobalt preparations comes from Saxony, Bohemia, Hesse, and Norway. The principal value of cobalt in the arts is due to the fact that its protoxid furnishes an intense and beautiful blue color, of importance in painting, and especially in the decoration of porcelsin and glass. (See smalt and safre.) Also spelled kobalt.—Cobalt blue. See blue.—Cobalt green. Cocculinidæ (kok-ū-lin'i-dē), n. pl. [NL., < Cocculina + ·idæ.] A family of rhipidoglossate gastropods. The technical characters are: dentition resembling that of the Fissurellidæ and Helicinidæ; only a single asymmetrical gill; no developed appendages to the side of the foot or on the mantle; and a patelliform, unfissured, unsinuated, and cutirely external shell.

Cocculus (kok'ū-lus), n. [NL., dim. of coccus: see coccus.] A tropical genus of menispermaceous plants, consisting of climbers, the leaves ceous plants, consisting of climbers, the leaves of which are usually more or less heart-shaped and the flowers small. Most of the commonly known species are now referred to allied genera.—Cocculus Indicus, a drug consisting of the dried fruit of Anamirta paniculata or A. Cocculus (also called Menispermum Cocculus, Cocculus suberosus, etc.), and probably of some other genera of the same order. It is used in medicine in the preparation of certain ointments, and is said to prevent secondary fermentation in liquors, for which reason it is sometimes used in the manufacture of heer. The powdered berries have a temporary stupefying effect upon fish, and are employed for their capture. The poisonous principle obtained from the kernels of the fruit has been termed picrotoxin.

They have a moderately curved beak, wide at the base and compressed beyond it,

ing to the Asiatic class, or a specimen of this variety. There are black, buf, euckoo, and white cochins, both cock and hen of each kind being of the uniform color denoted by the adjective, except that the buff eock should show a richer shade of yellow or orange in hackle, saddle, and whip-bows. The partridge cochins are either single-or pea-combed, the cock being similar in coloring to a black-breasted red game-cock, except that the hackle and the saddle-feathers should be striped with glossy black, and the hen be of a rich reddish- or golden-brown color, each feather distinctly peneiled with dark-brown or black. The hackle of the hen is orange, striped with black, her tail black, and the wing-primaries are dark-brown or dull-black. All the cochins have heavily feathered legs and short tails, and all have the legs yellow, except the black cochins, which have them black or nearly so.

cochin-china (kō'chin-chī'nā), n. and a. A term formerly applied to a large kind of domestie hen which was imported from Cochin-China. From these fowls, which had no constant characteristics of color, form, etc., have been bred the varieties called brahma and cachin.

E. dial. sow-bug, wood-louse.] 1. A dyestuff consisting of the dried of cochino, a pig; ct. E. chal. sow-oug, wood-louse.] 1. A dyestuff consisting of the dried bodies of a species of insects, the Coccus cacti, found upon several species of Opuntia and other Cactaceæ, especially O. Tuna, O. Ficus-Indica, and Nopalca cochinullifera. It colors a brilllant erlmson, which is changed by acids to an orange-red and by alkalis to violet; a brilliant scarlet dye is prepared from it. The cacti upon which the insect lives, bearing the general name of nopal, are extensively cultivated as food for them in the tropical countries of America, and in Java, Algeria, ctc. The females only are valuable for their col-

Or, and are collected twice a year, after they have been feeundated and have laid eggs sufficient for a new brood. They are killed by spreading them upon heated plates, by putting them in ovens, or by immersing them in boiling water or exposing them to its vapor. Those killed by heated plates are of a blacklish color, and are considered to be the finest; they are called zacatilla. Those from ovens are next in value; they are called zacatilla. Those from ovens are next in value; they are of an ash-gray (blanco or silver-white) color, and are called silver cochineal, or jaspeada. Those killed by water or vapor are of a reddish-brown color, and are the least valuable. The fragments, dust, and impurities from cochineal are collected and used as an adulterant, under the name of granilla. The finest grade often goes by the name of mestica or mesteque, and is exported in large quantities from Honduras. Besides the finer grades, which are cultivated becas, a considerable trade is carried on in infector or wild insects; they are searcely more than half the size of the cultivated species, and are covered with a coltony down which adds a uscless bulk. Good cochineal has the appearance of small, deep brown-red, somewhat purplish grains, wrinkled across lub back with parallel furrows, intersected in the middle by a longitudinal one. The coloring principle obtained from cochineal is carminic acid. (See carmine, 3.) East Indian cechineals, so called, are samooth glistening black grains, of no value; they are used to adulterate the genuine, which are easily distinguishable from them.

Cocoanut-palin (Cocos nucifera).

cocoa<sup>2</sup>.] A palm belonging to the genus Cocoa, producing the eocoanut. C. nucifera is everywhere cultivated in iropleai regions, but more especially on islands or near the sea. It has a cylindrical stem rising to a height of 60 to 90 feet, and surmounted by a crown of feather-like leaves from 18 to 20 feet long. The small white flowers grow on a branching spadix, inclosed in a hard tongh spathe. The fruits, called cocoanuts, are in bunches of from 12 to 20, and are of a subtriangular ovoid form, 12 inches long by 6 broad. They have each a single seed inclosed in a very hard shell, and surrounded by a thick fibrous rind or husk. This fiber, called coir, is made into cordage, matting, brusies, bags, etc. The flesh or meat of the cocoanut is a white pleasant-tasting mass, set and gelatinous when young, but afterward lining the shell in a thick close layer; it is largely used as a condiment and in cookery and confectionery, and yields the valuable cocoanut oil (which sec). The nut also contains when fresh from one to two pints of a clear pleasant liquid called the milk. The insture shell takes a high polish, and is made into drinking-cups and other utensis and ornaments. Its various uses make the cocoanut an important article of commerce. A spirit called toddy or arrack is made from the sweet juice of the spathe. Indeed, almost every part of the tree is employed in tropical countries for some useful purpose. The heart, which is seldom sound, is of a light yellowish brown color, which changes to a deep brown, almost black. The firm part of the trunk is the so-called poreupine-wood, which is very hard and durable, and is much used for all kinds of turnery, and especially for inlaying. Also called cocoa-tree, cocoanut-tree.

far south as Gibraltar. The principal cod-fisheries are on the banks of Newfoundland and the coasts of New England, but very valuable once also exist on the coasts of Norway. It is a very voracious fish, living in water from 25 to 50 fathoms deep, where it always feeds close to the bottom, and will take almost any kind of bait which may be offered. The cod reaches maturity at the end of the third year, when it usually measures about 3 feet in length and weighs from 12 to 20 pounds; individuals, however, have been taken weighing from 50 to more than 100 pounds. The cod is of great commercial importance both as a food-fish and as the source of cod-liver oil, which possesses nutritive and therapentic qualities of much value. Some variations in the size or quality of cod are indicated by terms expressive of the location in which they are taken, as deep-veater or shoal-water cod, shore or inshore cod, etc. The name is also extended, as a popular family term equivalent to Gadidae, to alt the species, and in different English-speaking countries is misapplied to various species of scorpænids, chirids, serranids, sparids, percophidids, and ophidids.

The ratio of the strain to the stress is called the coeficient of pliability.

Eneye, Brit., VI. 311.

Binomial coefficient. See binomial.—Coefficient of elasticity or of resilience, the ratio of the numerical value of a stress to the numerical value of the strain produced by it.—Coefficient of friction, the resistance to sliding between two surfaces divided by the pressure between them.—Coefficient of homology, the constant anharmonic ratio between corresponding points of two figures in homology, the point where the line through these points cuts the axis of homology and the center of homology, or between two corresponding rays, the line from their intersection to the center of homology, and the axis of homology.—Coefficient of torsion, the angle of torsion produced in a wire of unit dimensions by a force of unit moment.—Cubical coefficient of expansion, the rate of increase of the volume of a body of unit volume with the temperature.—Differential coefficient, in the calculus, the measure of the rate of change of a function relatively to its variable. A partial differential coefficient is the measure of the rate of change of a function of several independent variables relatively to one of them. A second differential coefficient is the differential coefficient of the differential coefficient of a function, both differential coefficients, being taken relatively to the same variable. Third, fourth, etc., differential coefficients are coefficients of an imaginary quantity, the quotient after dividing the quantity by its modulus.—Dynamical coefficient of viscosity divided by the density; the dynamical coefficient is an obtained.—Directional coefficient, of an imaginary quantity, the quotient after dividing the quantity by its modulus.—Dynamical coefficient of viscosity divided by the density; the lindex of friction of a fluid.—Laplace's coefficients, certain quantities need in the development of

Same as Cœlacanthidæ.

Same as Coucanthude.

Cœlacanthus (sē-la-kan'thus), n. [NL. (Agassiz, 1843), ζ Gr. κοῦλος, hellow, + ἀκανθα, thorn, spine.] The typical genus of ganoid fishes of the family Cœlacanthidæ: so called from their spines, which were filled with a softer sub-

stance, but have become hollow from its loss in the course of petrifaction.

cœlanaglyphic (sē "la-na-glif'ik), a. [⟨ Gr. κοίλος, hollow, + anaglyphic, q. v.] An epithet applied to that species of carving in relief in which no part of the figure represented projects beyond the surrounding plane, the relief being effected by deeply incising the outlines. J. T. Clarke. This is the most usual method of relief in an Clarke. This is the most usual method of relief in ancient Egyptian work, the figures when carved being brightly colored, and the incised outline being apparent only by side light. Also koilanaglyphic, coilanaglyphic. See

cœlarium (sẽ-lā'ri-um), n.; pl. cœlaria (-ä).

[NL, ζ Gr. κοῖλος, hollow.] In zoöl., the epithelium of the body-cavity or cœloma; a kind of
vasalium or endothelium lining the serons sur-

vasaltum or endochellim litting the serons surfaces. It is divided into the parietal cœlarlum er exocedarium and the visceral cœlarlum or endocœlarlum. Hacckel. Also called cœlom-epithelium.

Cœlebogyne (sē-le-boj'i-nē), n. [NL., irreg. < L. cœlebs, cœlebs, unmarried (seo celibate), + Gr. γννή, a woman.] An Australian genus of diœcions plants, natural order Euphorbiaccw, of a single species, C. ilicifoliu, sometimes referred to Alchornea. In amearance they much resemble the European holly. The pistillate plant has long been in cultivation in European gardens, and is remarkable for producing seeds without the action of pollen, an instance of the phenomenon of parthenogenesis, which is exceedingly rare in plants.

cœlebs (sē'lebs), n. [〈L. cœlebs, cœlebs, a bachelor: see celibate.]

1. A bachelor: used as a quasi-proper name: as, "Cælebs in Search of a Wife" (the title of a book by Hannah More). Cœlebs has become a benedick. G. P. R. James.

2. [NL.] In ornith., an old, now the specific, name of the chaffinch, Fringilla cœlebs: made a generic term by Cuvier in 1800.

cœlelminth (se'tel-minth), n. One of the Cælelminth of the continuous setting.

generic term by Carrell Gell-minth (se lel-minth), n. One of the mintha; a cavitary.

Collemintha (se lel-min'thä), n. pl. [NL., ζ Gr. koiλoc, hollow, + ελμινς (ελμινθ-), a worm, a tapeworm.] In Owen's system of classification, a division of Entozoa, comprising internal parasitic worms which have an alimentary canal or digestive cavity, and including the cavitaries, roundworms, threadworms, etc.: the opposition of Sterelminthu.

Collowing to or resembling Thank (se lel-min'thik), a. [⟨ Caclel-min'thik), a. [⟨ Caclel-min'thik),

Cœlentera (sē-len'te-rā), n. pl. [NL., ⟨ Gr. κοίλος, hollow, + ἐντερον, intestine: see entera.]

1. A phylum or subkingdom of animals, one of the prime divisions of Metazou, containing aquatic and almost invariably marine animals of the prime divisions of Mctazoa, containing aquatic and almost invariably marine animals with a distinct enteric cavity opening by a mouth and communicating freely with the general body-cavity (whence the name). This general cavity is known as an enteroccele, in distinction from an intestinal canal proper. The walls of the body are substantially composed of two layers, an inner or endoderm, and anouter or ectoderm. There are no traces of a nervous system, except in certain mediuse, and there is no proper blood-vascular system. Peculiar stinging-organs, thread-cells, enidae, or nematocysts are very generally present (in all the Cnidaria or ceclenterates proper), and in most cases the arrangement of parts or organs is radiate, as is especially observable in the disposition of tentacles around the mouth. Reproduction is usually sexual, distinct generative organs being present, and ova and spermatozoa being discharged by the mouth; but multiplication also takes place by budding and fission. The Calentera proper, or Cnidaria, are divided into the two great classes of Actinozoa and Hydrozoa, including all the sea-anemones, corals, acalephs, medusas, etc. In a wider sense, the sponges and etenophorans are also included.

2. A lower series or grade of metazoic animals including the Porifera or sponges and Nematophora or ecclenterates proper: used in distinction from Calomata, which covers all higher Metazoa indiscriminately. E. R. Lan-Later. Histip propers.

higher Metazoa indiscriminately. E. R. Lankester. [Little used.]—Cœlentera nematophora, the nematophoraus, endariaus, or celenterates which have thread-cells. See Cnidaria, Nematophora.—Cœlentera porffera, the sponges, which have no thread-cells. See Porifera.

Gelenterata (sō-len-te-rā'tä), n. pl. [NL., neut. pl. of cælenteratus: seo cælenterate.] Same Cœlenterata (sō-len-te-rā'tä), n. pl. as Cælentera.

ccelenterate (sē-len'te-rāt), a. and n. [< NL. ccelenteratus, < Gr. κοίλος, hollow, + ἐντερον, intestine: see entera.] I. a. Pertaining to or having the characters of the Ccelentera.

In such celenterate animals as polypes, we see the parts moving in ways which lack precision.

H. Spencer, Data of Ethics, p. 67.

II. n. A member of the animal subkingdom Cælentera.

century, a name of various modifications of coloma (sē-lō'mä), n.; pl. colomata (-ma-tä). the harpsichord, clavichord, and pianoforte, in [NL., ⟨Gr. κοίλωμα(τ-), a hollow, cavity, ⟨κοίλουν, which the usual tone of the instrument was make hollow, ⟨κοίλος, hollow: see colum.] The alterable at will by certain mechanical devices. ed from the intestinal cavity; the periaxial, peried from the intestinal cavity; the periaxial, perivisceral, or perienteric space. In a two-layered germ, or gastrula, it is an Interval between the two layers, that is, between the endoderm and the ectoderm, and either represents a blastoccale (the original cavity of a blastula before invagination) or is a subsequent formation having the morphological relations of a blastoccale. In a four-layered germ, in which a mesoderm has developed, it is an interval between layers of mesoderm, in some of its various modifications called an enteroccale, a schizoccale, or an epicele. In an adult organism it is the general cavity of the body, usually shut off from all special cavities, as those of the viscera. Also catom, calone.

Colomata (sc-16'ma-til), n. pl. [NL., prop. pl. of an adj. \*cæloma: see cæloma.] 1. A term used by E. R. Lankester to cover a second or higher grade or series of Metazoa, including all metazoie animals indiscriminately excepting

metazoic animals indiscriminately excepting the sponges and coelenterates, which consti-tute a first or lower series of *Metazoa* called Colentera. The word connotes the formation of a coloma, or body-cavity, distinct from the enteric cavity, not in common therewith, as in Carlentera. [Little used.] 2. [l. c.] In embryol., the diverticula or buds of the archenteron or primitive stomach, out of

which a cocloma is formed after their separation

which a cecloma is formed after their separation from the archenteron. A. Hyatt. celomate (se-lō'māt), a. and n. [As cælom, cæloma(t-), with term. accom. to -atel. Cf. cælomatous.] I. a. Having a cæloma or bodycavity: the opposite of acælomate or acælomatous. Also cælomatous.

The Mollusca agree in being Carlomate with the phyla Vertebrata, Platyhelmia (Flat-worms), Echinoderma, Ap-pendiculata (Insects, Ringed-worms, &c.), and others. E. R. Lankester, Encyc. Brit., XVI, 633.

The two ealomatic tubes nipped off from the enteron gradually increase in size.

Gegenbaur, Comp. Anat. (trans.), p. 216.

cœlomatous (sē-lom'a-tus), a. [As cælomate + -ous.] Same as cælomate.

cœlome (sē'lōm), n. Same as cæloma

The berry of trees belonging to the genus Coffea, natural order Rubiaeeæ. Several species, but principally C. Arubica, produce the coffee of commerce. It is a native of Arabia and Abyssinia, but is now extensively cultivated throughout tropical countries. It will grow to the height of 18 or 18 feet, but is seldom permitted to exceed 8 or 9 feet, for the convenience of gathering the fruit. The stem is upright, and covered with a lightbrown bark; the branches are horizontal and opposite. The flowers grow in clusters at the bases of the leaves, are pure white, and of an agreeable odor. The fruit is a small, red, fleshy berry, having the size and appearance of a small cherry. Each berry contains two seeds, commonly called coffee-beans or coffee-nibs. When ripe the berries are gathered, and the outer pulp and the parchment-like covering of the seeds are removed. The Mocha coffee from Venen in Arabia is reputed the best; but the principal supplies are now obtained from Ceylon, Java, the West Indies, Brazil, and Central America. The Liberian coffee-tree, C. Liberica, of western tropical Africa, has recently

been introduced into cultivation. It grows to a greater size and yields a much larger berry than C. Arabica, and thrives in low damp regions where the latter will not flourish. What is known as the male coffec-berry is simply a re-

sult of the occasional coalescence of the two seeds fruit into one, and differs in no other respect from the or-dinary herry. The name cherry-coffee is given to the coffee-berry as it comes from the tree, before the pulp has been removed or the seeds have been dried.

2. A drink made from the seeds of the coffee-2. A drink made from the seeds of the coffee-tree, by infusion or decoction. Before being used the seeds are roasted, and then ground in a coffee-mill, or, as in the East, pounded. The beverage is best when made with coffee-beans freshly roasted and ground. Coffee acts as a slight stimulant, promoting cheerfulness and removing languor; but in some cases it induces sleeplessness and nervous tremblings. The use of it originated in Abyssinia, passed to Arabia several centuries later, and is said to have been made known in Europe by A. Rauwolf, a German physician, whose travels appeared in 1573.

Sandys, Travalles, p. 51.

The coffee-house must not be dismissed with a cursory mention. It might indeed, at that time, have been not improperly called a nost important political institution. . . The coffee-houses were the chief organs through which the public opinion of the metropolis vented itself. . . Every man of the upper or middle class went daily to his coffee-house to learn the news and discuss it. Every coffee-house had one or more orators, to whose eloquence the crowd

listened with admiration, and who soon became what the journalists of our own time have been called—a fourth estate of the realm.

coherent (kō-hēr'ent), a. [= F. cohérent = Sp. Pg. coherente = It. coerente, < L. cohæren(t-)s, ppr. of cohærere, stick together, cohere: see cohere.] 1. Sticking, or sticking together; eleaving, as the parts of a body, solid or fluid, or as one body or substance to another; adhesive.

Consequently when insects visit the flowers of either form . . . they will get their forcheads or proboscides well dusted with the coherent pollen.

Darwin, Different Forms of Flowers, p. 96.

The lower angle of each frustule is coherent to the mid-dle of the next one beneath.

ii'. B. Carpenter, Micros., § 292.

2. Connected; consistent; having a natural or due agreement of parts; consecutive; logical: said of things: as, a coherent discourse.

An unerring eye for that fleeting expression of the moral features of character, a perception of which alone makes the drawing of a coherent likeness possible.

Lovell, Study Windows, p. 125.

From the earliest times that men began to form any coherent idea of it (the world) at all, they began to guess in some way or other how it was that it all began, and how it was all going to end.

W. K. Clifford, Lectures, I. 191.

3. Observing due order, connection, or arrangement, as in thinking or speaking; consistent; consecutive: said of persons.

A coherent thinker and a strict reasoner is not to he made at once by a set of rules.

Watts, Logic.

4. Suited; fitted; adapted; agreeing.
Instruct my daughter how she shall persever,
That time and place, with this deceit so lawful,

cohesion (kō-hē-zhon), n. [= F. cohésion = Sp. cohesion = Pg. cohesão = It. cocsione, < L. as if \*cohæsio(n-), < cohærere, pp. cohæsus, stick together: see cohere.] 1. The act or state of cohering, uniting, or sticking together; specifically, in phys., the state in which, or the force by which, the molecules of the same material are bound together, so as to form a continuous hobound together, so as to form a continuous homogeneous mass. This force acts sensibly at insensible distances—that is, when the particles of matter which it unites are placed in apparent contact. At insensible distances it is a much greater, at sensible distances a much smaller, force than gravitation, so that it does not follow the law of variation of the latter. It unites the particles of a homogeneous body, and is thus distinguished from adhesion, which takes place between the molecules of different masses or substances, as between fluids and solids, and from chemical attraction, which unites the atoms of a molecule together. The power of cohesion in a body is estimated by the force necessary to pull its parts asunder. In general, cohesion is most powerful among the particles of solid bodies, weaker among those of fluids, and least of sall, or entirely wanting, in clastic fluids, as air and gases. Ilardness, softness, tenacity, clasticity, malleability, ductility, and in crystallized bodies cleavage, are to be considered properties dependent upon cohesion. The most powerful influence which tends to diminish cohesion is heat, as shown in the change of a solid to a liquid, or of a liquid to a gas, which is effected by it. See gas and liquid.

2. In bot., the congenital union of one part with another. If the parts are similar, as two stamens, their values is considered and the parts are similar, as two stamens, their values is considered. bound together, so as to form a continuous hoanother. If the parts are similar, as two stamens, their union is specifically called codescence; if dissimilar, as calyx and overy, it is styled adnation.

The greatest atrength of that prevailing Faction (the Romish religion) lies in the close union and cohesion of all the parts together.

Stillingfeet, Sermons, II. i. Cohesion figures, a class of figures produced by the attraction of liquids for other liquids or solids with which they are in contact, and divided into surface, submersion, breath, and electric cohesion figures. It was found by C. Tomlinson, an English physicist, that a drop of liquid, as of oil or alcohol, spreads itself out on the surface of water always in a definite figure, the figure differing with each fluid dropped on the water; and he suggested that this might he employed as a test for oils, etc. The same principle holds true with regard to liquids which, from greater specific gravity, sink slowly to the bottom in water, each liquid submerged forming a definite figure peculiar to itself. Breath figures are produced by putting a drop of the liquid to be examined on a slip of mica and breathing on it, when again each fluid takes a distinct characteristic shape. Electric cohesion, figures are produced by electrifying drops of various liquids placed on a plate of glass.—

Magnetic cohesion, that power by which two magnetic bodies adhere together, as iron to a piece of lodestone.

cohesive (kō-hō'siv), a. [= Sp. Pg. cohesivo, < L. cohæsus, pp. of cohærere, cohere.] 1. Characterized by, causing, or concerned in cohesion or the quality of adhering together, literally or figuratively: as, cohesive force.

The Tory party is far more cohesive than the Liberal party, far more obedient to its leaders, far less disposed to break into sections, each of which thinks and acts for itself.

New Princeton Rev., 111. 60.

2. Having the property of cohesion; capable of cohering or sticking; having a tendency to unite and to resist separation: as, a cohesive substance.

The nests are built of strong cohesive clay.

Sir J. E. Tennent, Ceylon, ii. 6.

coke<sup>1</sup> (kôk), n. [Sometimes spelled coak; same
as E. dial. cokes, coaks, cinders. Cf. grindlecoke, a worn-down grindstone. Phonetically, coke may be compared with cake (cf. LG. koke, cake, and see cake¹); but coke does not "cake." Hence F. coke, Sp. cok, G. koaks, kohks, usually coaks, etc., coke.] The solid product of the carbonization of coal, bearing the same relation to bonization of coal, bearing the same relation to that substance that charcoal does to wood. It is an important article in metallurgy, since few bituminous ceals can be used for the manufacture of iren without having been first coked. The coking coals, as they are called, are bituminous, and such as contain but a small percentage of water. Hence the coals as recent as the Tertiary—brown-coals or lignites—rarely furnish coke; that is, the material left behind after the bituminous or volatile matter has been driven eff is a powder, and not the coherent somewhat vesicular substance to which the name of coke is given. The nature of the difference between coking and non-coking coals has not yet been fully made out, and it is stated on good authority that some coal which cokes readily when first mined does not do so after having been exposed to the atmosphere, if only for a few days. The use of coke dates certainly as far back as the middle of the seventeenth century. Its preparation was formerly known as charking or charring, and the word was often, and is still occasionally, written coak.

collect (kol'ekt), n. [< ME. collect, collect, < LL. collecta, a meeting (L. a collection in money), in ML. also a meeting for prayer, and (for oratio ad collectam, a prayer at a preliminary service in one church, before proceeding to another church to attend mass, a prayer at the latter church being called oratio ad missam) a prayer, etc.: see collect, v.] 1. In the Roman Catholic, Angliean, and other Western liturgies: (a) A coneise prayer, varying according to the day, week, octave, or season, recited before the epistle, regularly consisting of one sentence, and asking for some grace or blessing with reference to some some grace or blessing with reference to some teaching of the epistle or gospel, or both. A collect is composed of an address to the Trinity or to one of the Divine Persons, a petitlen thus introduced, and the pleading of Christ'a merits or final ascription to a Person of the Trinity. One collect may be used alone or several m succession. Collects regularly belong to the eucharistic office, but are repeated in the day-offices (hours, morning and evening prayer), thus forming a constant link between the latter and the altar service. They are characteristic of Western liturgies and offices, not being known in the Eastern churches. Almost all those still in use are very ancient, and the origin of this form of prayer is a tleast as old as the fifth century. Lee the Great (440-61) and Gelasius 1, (492-96) are reputed the first composers of collects. See oratio.

The unity of sentlment and severity of style which characterise these little pieces [Milton's Sonnets] remind us . . . of the Collects of the English Liturgy.

Macaulay, Milton.

White the East, again, soars to God in exclamations of angelic self-forgetfulness, the West comprehends all the spiritual needs of man in Collecte of matchless prefundity.

collectivism (kg-lek'tiv-izm), n. [< collective + -ism; = F. collectivismc.] The socialistic theory or principle of centralization of all directive social and industrial power, especially of control of the means of production, in the people collectively, or the state: the opposite of individualism.

vidualism.

As used in current speech, and also in economics, no very definite line of distinction between communism and socialism can be drawn. Generally speaking, communism is a term for a system of common property, and this should be accepted as the reasonably correct usage of the word; but even by socialists it is frequently used as practically synonymous with socialism. Collectivism is a word which has recently come into vogue to express the economic basis of socialism as above explained.

Energy. Brit., XXII. 207, note.

Collectivism, which is now used by German as well as by French writers, denotes the condition of a community when its affairs, especially its industry, are managed in the collective way, instead of the method of separate, individual effort. Woolsey, Communism and Socialism, p. 4.

collectivist (ko-lek'tiv-ist), n. and a. I. n. [</br>

in the principle of collectivism; especially, one who holds that the materials of production, as the soil, should belong to the people at large.

The collectivity of living existence becomes a self-improving machine.

Pop. Sci. Mo., XXI. 436.

Specifically -3. The people of a commune or state taken collectively; the people at large; the citizens as a whole.

The Marxists insisted that the social regime of collective property and systematic co-operative production could not possibly be introduced, maintained, or regulated, except by means of an omnipotent and centralised political authority—call it the State, call it the collectivity, call it what you like—which should have the final disposal of everything.

Rae, Contemp. Socialism, p. 140.

4. Collectivism; especially, the ownership on the part of the state or the people at large of all means of production, especially of the soil.

Collectivity, in the dialect of the Socialists, means the ownership of all the instruments of production by the state, and its use of them in such manner as shall seem best calculated to eradicate or diminish poverty.

2. (a) An endowed and incorporated community or association of students within a university. See university. A college corporation in the English universities consists of a master, fellows, and scholars. (b) The institution or house founded for the accommodation of such an association. Such houses began to be established about A. D. 1200, as charitable foundations for affording food and lodging to poor students, and did not at first undertake to subject them to any regular discipline or to order their studies. But schools were early attached to them, and the entire instruction of most of the universities was ultimately given in the colleges.

The primary object of a college is not the teaching of anybody; it is the maintenance in an incorporated society of some of those who come to profit by the teaching and other advantages of the University.

Contemporary Rev., II. 616.

The name college seems first to have been specially applied to the houses of religious orders, where were accommodated those youths who meant to devote themselves wholly to a "religious" life.

collimation (kol-i-mā'shon), n. [< collimate (see ation); = F. collimation = Pg. collimação. Cf. collimeation.] The accurate adjustment of the line of sight of a telescope. A telescope having only one motion, as a meridian instrument or a surveyors level, is in collimation when the mean of the wires or other assumed point apparently traverses a great circle of the heavens when the telescope is rotated. The error of collimation, or the distance of the small circle actually described, when the line of sight is not accurately adjusted, from the parallel great circle, is also familiarly called the collimation. It is measured by reversing the telescope in its bearings and measuring half the angular distance between the two objects thus auccessively brought to the mean position of the wires. Two telescopes are said to be in collimation, the line in which the optical axis of the telescope ought to be.

collodion (ko-lō'di-on), n. [NL., also collodium, < Gr. κολλώης, like glue, < κόλλα, glue, + είδος, semblance.] A substance prepared by dissolving pyroxylin or guncotton in ether, or in a mixture of ether and alcohol. It forms a useful substitute for adhesive plaster in the case of slight wounds. When the solution is applied to the wound, it immediately dries in a semi-transparent, tenaclous flim, which adheres firmly to the part, and protects the wound or abrasion. With the addition of a small quantity of iodides and bromides, collodion is employed as the basis of a photographic process, called the collodion or vet process. To obtain a negative picture by this process, a glass plate is covered with a film of collodion, which is sensitized by salt (usually the mitrate) of silver, and the plate exposed in the camera. The latent image obtained is then developed by the application of a solution of fron protosulphate, water, and acetic acid, and the unprecipitated silver remaining in the film is dissolved by a fixing solution of sodium hyposulphite or of potassium cyanide. To obtain a positive picture, a sheet of paper is laid upon the face of the negative in a frame, the paper having been sensitized by floating on a solution of silver nitrate, or by any other of several methods. The frame is then exposure is continued till the tone is sufficiently deep, after which the tint is improved by means of gold chlorid and other salts, and the pleture fixed with sodium hyposulphite the tint is improved by means of gold chlorid and other salts, and the pleture fixed with sodium hyposulphite foolion process. Collodion is used also as a water-proof to cotain in place of varnish, especially to protect lucifer matches from the effects of dampness.

They are distinguished by the gelatinous character of their hydrates. Although often largely soluble in water, they are held in solution by a most feeble force. They appear singularly inert in the capacity of acids and bases, and in all the ordinary chemical relations. But, on the other hand, their peculiar physical aggregation, with the chemical indifference referred to, appears to be required in substances that can intervene in the organic processes of life. The plastic elements of the animal body are found in this class. As gelatine appears to be its type, it is proposed to designate substances of the class as colloids.

colon<sup>1</sup> (kō'lon), n.; pl. cola (-lä) in senses I, 2, and 3, colons (-lonz) in sense 4. [= D. colon = G. Dan. Sw. kolon = F. Sp. Pg. colon = Icolon, colo, < L. cōlon, a member of a verse or poem, < Gr. κῶλον, a member, limb, clause, part of a verse.] 1. In anc. gram, and rhet., one of the larger or principal divisions of a sentence or period; a long clause, or a group of minor clause. period; a long clause, or a group of minor clauses or commata. See comma, 1.—2. In anc. pros., one of the members or sections of a rhythmical period, forming an uninterrupted sequence of feet, united under a principal ictus or beat: feet, united under a principal ictus or beat: sometimes called a series. A colon could not consist of more than 6 trisemic, 5 tetrasemic or pentasemic, or 3 hexasemic feet. It usually corresponded to one of the lines of a modern couplet, triplet, or stanza, or formed part only of a longer line. A pure colon is a colon consisting of feet of one kind only; a mixed colon is composed of feet of different kinds. See period.

3. In paleography, a long clause or group of clauses, or a series of words of about the average length of such a group estimated as any

age length of such a group, estimated as approximately equal to a daetylic hexameter in extent - that is, as containing from 12 to 17 syllables. A colon in this sense was frequently written as a separate line in manuscript, and served to measure the length of a book or treatise. See colometry and epos.

4. A mark of punctuation formed by two dots

like periods placed one above the other (:), used to mark a discontinuity of grammatical construction greater than that indicated by the semicolon and less than that indicated by the semicolon and less than that indicated by the period. The colon is commonly used (1) to emphasize a close connection in thought between two clauses of which cach forms a complete sentence, and which might with grammatical propriety be separated by a period; (2) to separate a clause which is grammatically complete from a second which contains an illustration or amplification of its meaning; thus, in this work illustrative clauses introduced by "as" are separated from the definition by a colon; (3) to introduce a formal statement, an extract, a speech in a dialogue, etc. Originally it was the mark of the termination of the grammatical or paleographic division called by the same name, and it is now frequently used to mark off metrical periods in prose intended for chanting.

testine, continuous from the ileum to the rectum; the great gut, beginning at the excum testine, continuous from the ileum to the rectum; the great gut, beginning at the execum and ending in the sigmoid flexure. In man and mammals generally the colon is distinguished from the preceding small intestine by its greater caliber, and by its sacculation, due to the particular distribution of its circular muscular fibers, which constrict it at some places and allow it to bulge out at others, making a series of pouch-like expansions. It may also present continuous bands of longitudinal fibers, or lengthwise constrictions, so that the cross-section is not circular. The colon may not be distinguishable in size or appearance from the rest of the intestine, as in birds, where its commencement is marked only by the presence of a cream or of two ceea; and when these are wanting, there is no distinction. In man the course and situation of the colon are definite, owing to the binding of the gut in place by the mesocolon and gastrocolic omentum. Beginning at the coccum and ascending by the right kidney, it passes under the concave surface of the liver and the bottom of the stomach to the spleen; thence descending by the left kidney, it passes in the torm of an S to the upper part of the sacrum, where it becomes the rectum. The parts of the colon are designated according to their position or direction; as, the right lumbar or ascending colon; the reft lumbar or descending colon; and the sigmoid flexure, or left iliac colon. See cuts under adimentary and intestine.

2. In entom, the second portion of an insect's intestine generally broader than the preceding

2. In entom, the second portion of an insect's intestine, generally broader than the preceding portion or ileum. It may be straight or convoluted, terminating at the anal opening, or separated from it by a short rectum.

The E. word, orig. pron. as spelled, cor-o-nel', cor'o-nel, became, by regular phonetic change, cor'nel, and now cur'nel (ker'-nel) (being often so spelled in novels and character sketches which seek to be realistic), retaining the r of its Sp. form; but the spelling was soon changed to suit the F. form, which was much more familiar to the eye of readers. In the British army, except in the artillery and engineers, the office of colonel is often honorary, and is generally conferred on distinguished officers and princes of the blood royal, the real command resting with the lieutenant-colonel in each battalion, who after five years of service becomes a colonel. Generals who have had what is called "a regiment given to them" as a reward for service, and virtually as a retirement, have the rank of colonel. In the Russian, German, and Austrian armies the colonel of each regiment, holding the title only as an honor, is usually a member of some princely or other eminent family, often foreign, and sometimes appointed in childhood. A company or body of people who migrate from their native country or home to a uew province, country, or district, to cultivate and inhabit it, but remain subject to or intimately connected with the parent state; also, the descendants of such settlers se long as the connection with the mother country is retained. the descendants of such settlers so long as the connection with the mother country is retained. Among the ancient Greeks the simple colony, which was not necessarily dependent upon the parent state except in religious matters, must be distinguished from a cleruchy (which see). Among the Romans the earliest colonies, so called, were merely garrisons in a hostile territory. Later, colonies were founded for the benefit of the poor of Rome; but Sylla restored the military character to the colony, which became in general a foundation for the benefit of veteran soldiers who had served their time. The colonists retained their Roman citizenship, and received their lands by lot, the original inhabitants of the site being subordinated to them. In American history the name is given especially to the thirteen separate communities along the Atlantic coast under English rule which combined in the revolution, and were formed in 1716 into the United States of America. They were (in geographical order) New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Maryland, Delaware, Virginia, North Carolina, South Carolina, and Georgia. These were all originally English colonies excepting New York and Delaware, which were for a time respectively Dutch (as New Netherland) and Swedish (as New Sweden). Their governments were by charter (in Massachusetts, Rhode Island, and Connecticut), proprietary (in Pennsylvania, Delaware, and Maryland), or royal (in the remaining colonies). In each (except Rhode Island and Connecticut, which chose their own governors) the governor was appointed by the crown or by the proprietaries. The crown claimed a veto on legislation, and jurisdiction of appeals from the court of last resort.

For the transfer of sense, cf. Gr. χροιά, χρόα, surface, skin, color.] 1. Objectively, that quality of a thing or appearance which is perceived by the eye alone, independently of the form of the thing; subjectively, a sensation, or the class of sensations, peculiar to the organ of vision, and arising from stimulation of the optic nerve. The proper timulus to the sensation of color is light radiated. thing; subjectively, a sensation, or the class of sensations, peculiar to the organ of vision, and arising from stimulation of the optic nerve. The proper stimulus to the sensation of color is light radiated from a luminous body; but it can be induced by other means, as by an electric shock. When a ray of white light is analyzed, as by a prism, into parts each of a definite wave-length, the parts show the colors red, orange, yellow, green, blue, indigo, and violet, whilch form a continuous apectrum, each color shading gradually into the next. (See light and spectrum.) These colors have been termed primary or simple, though in fact they do not excite simple color-sensations. If the colors of the apectrum are recombined, white light reappears. Similarly, if two colors which ile near together in the spectrum, both on the same side of light of wave-length 0.524 micron, are mixed (for example, if two rays of colored light are thrown upon the same spot so as to be reflected from it together), the intermediate colors are nearly produced. If, however, the colors, being on different sides of that point, are taken further and further apart in the spectrum, the mixture becomes gradually whiter (less saturated) until two colors are found which produce pure white light. If the colors are still further removed, a purple results. Those pairs of colors which when nixed produce white or gray light are called complementary colors; such are red and green-blue, orange and blue, yellow and indigo-blue, green-yellow and volet. The sensations produced by the different parts of the spectrum, however, vary with the intensity of the light: thus, orange when highly lluminated looks more yellow than when darker, and the main effect of increasing the illumination of a color is to add a yellow color-sensation, called the color of brightness. If, instead of mixing spectral colors, colored pigments are mixed, very different results are obtained: thus, which roughly corresponds to the mean wavelength of the light emitted. Positive colors, those colors which are unbroken by such accidents as affect neutral colors.—Primary colors. (a)

The seven colors into which Newton arbitrarily divided the spectrum. See def. 1, above. (b) The colors red, yellow, and blue, from the mixture of which it was erroneously supposed (from the facts of the mechanical mixture of pigments) all other colors could be produced. (c) The red, green, and violet light of the spectrum, from the

mixture of which all other colors can be produced. Also called fundamental colors.—Pulp-colors, the name given by paper-stainers and calico-printers to colors ground in water.—Pure color. (a) A color produced by homogeneous light. (b) Any very brilliant or decided color. (c) In painting, color in which each hue is lighted or shaded only with a modification of itself, and not with a totally different hue. Thus, a brick wall painted in pure color will be red in both aunlight and shadow, as distinguished from a representation of such a wall as red in the sun, and blue, gray, or brown in the shade.—Secondary colors. See eccondary.—Spirit colors, certain colors obtained in calico-printing, so called from the use of "spirits," the technical name for the acid solutions of tin, in applying the colors.
